MEDIATEK CONFIDENTIAL

Address	Name	Width	Register Function
			detection status can be disabled.
1124000C	**MSDC_INT**	32	**MSDC Interrupt Register** Contains the status of interrupts Note: The register still shows the status of interrupt even though the interrupt is disabled.
11240010	**MSDC_INTEN**	32	**MSDC Interrupt Enable Register** Contains related enabling bit of interrupts
11240014	**MSDC_FIFOCS**	32	**MSDC FIFO Control and Status Register** Contains control and status of embedded 128B FIFO
11240018	**MSDC_TXDATA**	32	**MSDC TX Data Port Register** For PIO mode only. Used to input MSDC write data to card. The access can be AHB1B/2B/4B.
1124001C	**MSDC_RXDATA**	32	**MSDC RX Data Port Register** For PIO mode only. Used to read back MSDC read data from card. The access can be AHB1B/2B/4B.
11240030	**SDC_CFG**	32	**SD Configuration Register** Configures MS/SD memory card controller when it is configured as the host of SD memory card. If the controller is configured as the host of memory stick, the contents of the register will have no impact on the operation of the controller.
11240034	**SDC_CMD**	32	**SD Command Register** Defines a SD memory card command and its attributes. Before MS/SD controller issues a transaction onto SD bus, the application should specify other relative settings such as argument for command. After writing the register by the application, MS/SD controller will issue the corresponding transaction onto SD serial bus. If the command is GO_IDLE_STATE, the controller will have serial clock on SD/MMC bus running 128 cycles before issuing the command.
11240038	**SDC_ARG**	32	**SD Argument Register** Contains argument of SD/MMC memory card command
1124003C	**SDC_STS**	32	**SD Status Register** Reflects SD bus status and contains MMC stream write status
11240040	**SDC_RESP0**	32	**SD Response Register 0** Contains parts of the last SD/MMC memory card bus response. See description in register field SDC_RESP3.
11240044	**SDC_RESP1**	32	**SD Response Register 1** Contains parts of the last SD/MMC memory card bus response. See description in register field SDC_RESP3.
11240048	**SDC_RESP2**	32	**SD Response Register 2** Contains parts of the last SD/MMC memory card bus response. See description in register field SDC_RESP3.
1124004C	**SDC_RESP3**	32	**SD Response Register 3** Contains parts of the last SD/MMC memory card bus response. Register fields SDC_RESP0, SDC_RESP1, SDC_RESP2 and SDC_RESP3 are composed of the last SD/MMC memory card bus response. For response of type R2, i.e. response of the command ALL_SEND_CID, SEND_CSD and SEND_CID, only bit 127 to 0 of response token are stored in register field SDC_RESP0, SDC_RESP1, SDC_RESP2 and SDC_RESP3. SDC_RESP0 = bit 31~0 SDC_RESP1 = bit 63~32 SDC_RESP2 = bit 95~64 SDC_RESP3 = bit 127~96 For response of type R1b in auto CMD12 or R1 in auto CMD23, bit 39 to 8 of response token are stored in register field of SDC_RESP3. For the responses of other types, only bit 39 to 8 of response token are stored in the register field SDC_RESP0.

MEDIATEK CONFIDENTIAL

Address	Name	Width	Register Function
11240050	SDC_BLK_NUM	32	**SD Block Number Register** Defines block number for block transaction. For single read/write, this register should be set to 1. For multiple read/write, this register should be set to bigger than 1. Set to 0 will cause unexpected result.
11240054	SDC_VOL_CHG	32	**SD Voltage Change Wait Time Register** Defines SD voltage change check wait time.
11240058	SDC_CSTS	32	**SD Card Status Register** After commands with R1 and R1b response, this register will contain the status of the SD/MMC card.
1124005C	SDC_CSTS_EN	32	**SD Card Status Enable Register** Controls which bit of SDC_CSTS will generate the MSDC_INT.SD_CSTA interrupt
11240060	SDC_DATCRC_STS	32	**SD Card Data CRC Status Register** Reflects CRC status of data line[7:0]. Only for MSDC read.
11240070	EMMC_CFG0	32	**EMMC Configuration Register 0** For boot-up mode general configuration of e-MMC version 4.3 and 4.4
11240074	EMMC_CFG1	32	**EMMC Configuration Register 1** For boot-up mode general configuration of e-MMC version 4.3 and 4.4.
11240078	EMMC_STS	32	**EMMC Status Register** Reflects status of e-MMC boot-up mode operation
1124007C	EMMC_IOCON	32	**EMMC IO Control Register** Controls H/W reset pin of e-MMC boot-up mode operation
11240080	SD_ACMD_RESP	32	**SD ACMD Response Register** Stores response of auto command from SD card
11240084	SD_ACMD19_TRG	32	**SD ACMD19 Target Register** Selects target delay line to run ACMD19 sequence
11240088	SD_ACMD19_STS	32	**SD ACMD19 Status Register** Stores result of auto command 19 from SD card
1124008C	DMA_SA_HIGH4BIT	32	**DMA Current Address Register of High 4 Bits** Contains start address high 4 bits of the 36-bit address for 64G DRAM access
11240090	DMA_SA	32	**DMA Start Address Register** Contains start address of DMA descriptor
11240094	DMA_CA	32	**DMA Current Address Register** Contains current DMA address
11240098	DMA_CTRL	32	**DMA Control Register** Controls DMA operation
1124009C	DMA_CFG	32	**DMA Configuration Register** Configures DMA operation
112400A0	SW_DBG_SEL	32	**MSDC S/W Debug Selection Register** Selects SW debugging output
112400A4	SW_DBG_OUT	32	**MSDC S/W Debug Output Register** Shows selected debugging output
112400A8	DMA_LENGTH	32	**DMA Length Register** Sets up basic DMA operation length
112400B0	PATCH_BIT0	32	**MSDC Patch Bit Register 0** Configures patch function. For normal function, this bit should be kept at default value.
112400B4	PATCH_BIT1	32	**MSDC Patch Bit Register 1** Configures patch function. For normal function, this bit should be

			kept at default value.
112400B8	PATCH_BIT2	32	**MSDC Patch Bit Register 2** Configures patch function. For normal function, this bit should be kept at default value.
112400C0	DAT0_TUNE_CRC	32	**DAT0 Tune Result Register** Records on-line tuning result for DAT0 line
112400C4	DAT1_TUNE_CRC	32	**DAT1 Tune Result Register** Records on-line tuning result for DAT1 line
112400C8	DAT2_TUNE_CRC	32	**DAT2 Tune Result Register** Records on-line tuning result for DAT2 line
112400CC	DAT3_TUNE_CRC	32	**DAT3 Tune Result Register** Records on-line tuning result for DAT3 line
112400D0	CMD_TUNE_CRC	32	**CMD Tune Result Register** Records on-line tuning result for CMD line
112400D4	SDIO_TUNE_WIND	32	**SDIO Tune Window Register 0** Defines tuning window size for SDIO on-line CRC tuning feature
112400F0	PAD_TUNE0	32	**MSDC Pad Tuning Register 0** Configures delay line embedded in pad macro
112400F4	PAD_TUNE1	32	**MSDC Pad Tuning Register 1** Configures delay line embedded in pad macro
112400F8	DAT_RD_DLY0	32	**MSDC Data Delay Line Register 0** Configures delay line embedded in pad macro
112400FC	DAT_RD_DLY1	32	**MSDC Data Delay Line Register 1** Configures delay line embedded in pad macro
11240100	DAT_RD_DLY2	32	**MSDC Data Delay Line Register 2** Configures delay line embedded in pad macro
11240104	DAT_RD_DLY3	32	**MSDC Data Delay Line Register 3** Configures delay line embedded in pad macro
11240110	HW_DBG_SEL	32	**MSDC H/W Debug Selection Register** Selects HW debug output
11240114	MAIN_VER	32	**MSDC Main Version Register** Shows the version code of MSDC IP
11240118	ECO_VER	32	**MSDC ECO Version Register** Shows the ECO version code of MSDC IP

11240000 MSDC_CFG MSDC Configuration Register 02000099

Bit(s)	Mnemonic	Name	Description
25	SCLKSTOPSEL	SCLK_STOP_SEL	**In DDR mode, stops SCLK when device is idle whether checking SCLK phase or not** 1'b0: Stop sclk not checking SCLK phase

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Mnemonic	Name	Description
			1'b1: Stop sclk checking SCLK phase; fix 1/4T sclk glitch in DDR mode
21:20	**CCKMD**	CARD_CK_MODE	**MS/SD card clock mode** 2'b00: Use clock divider output divided by msdc_src_ck as msdc_ck. bit[15]~bit[8] should be programmed. 2'b01: Use msdc_src_ck as msdc_ck. bit[15]~bit[8] is ignored. 2'b10: DDR mode; use clock divider output divided by msdc_src_ck as msdc_ck. bit[15]~bit[8] should be programmed. 2'b11: HS400 mode; use clock divider output and use msdc_src_ck as msdc_ck. bit[15]~bit[8] should be programmed.
19:8	**CCKDIV**	CARD_CK_DIV	**MS/SD card clock divider** Controls clock frequency of serial clock on MS/SD bus. Refer to "Data Line Latching Timing Diagram" and "Response Latching Timing Diagram". For non-DDR mode, msdc_ck equals SD bus clock. (Example: For SDR25 or HS, msdc_ck and SD bus clock will be 50MHz) For DDR mode, msdc_ck denotes MSDC internal clock which will be doubled to SD bus clock. (Example: For DDR50, msdc_ck should be set to 100MHz, and bus clock will be 50MHz.) 8'b00000000: msdc_ck =(1/2)*msdc_src_ck 8'b00000001: msdc_ck = [1/(4*1)]*msdc_src_ck 8'b00000010: msdc_ck = [1/(4*2)]*msdc_src_ck 8'b00000011: msdc_ck = [1/(4*3)]*msdc_src_ck 8'b00010000: msdc_ck = [1/(4*16)]*msdc_src_ck 8'b11111111: msdc_ck = [1/(4*255)]*msdc_src_ck
7	**CCKSB**	CARD_CK_STABLE	**MS/SD card clock is stable or not** After programming CARD_CK_MODE or CARD_CK_DIV, this bit will immediately become 0 and return to 1 if stable. Poll this register to ensure safety control of MSDC. 1'b0: Clock output is not stable. 1'b1: Clock output is stable.
6	**BV18PSS**	BV_1P8_PASS	**MSDC bus voltage 1.8V detection status** SW should check this bit after BUS_VOL_18V_START_DET turns to 0 from 1. 1'b0: Error in voltage detection 1'b1: No error in voltage detection
5	**BV18SDT**	BV_1P8_START_DET	**MSDC bus voltage 1.8V detection sequence start event** SW writes 1 to this bit to trigger HW outputting 1.8V clock for 1ms and automatically detecting CMD/DAT line sequence for voltage change is passed or not. HW will clear this bit to 0 after the detection is finished. The passed or failed status is stored in bit[6] BUS_VOL_18V_PASS.
4	**CCKDRVE**	CARD_CK_DRV_EN	**SD/MS card bus clock drive enable bit** Set this bit to 1 to enable MSDC bus clock driver. The default bus state depends on MSDC_CFG][1] CARD_CK_PWDN bit. If MSDC_CFG[1] CARD_CK_PWDN=1, the default clock state will be free running. If MSDC_CFG[1] CARD_CK_PWDN=0, the default clock state will be gated to 0. Set this bit to 0 will put the bus state into "tri-state". Default: 1 1'b0: Put the clock pad into tri-state 1'b1: Enable MSDC to drive clock pad. The state of CLK depends on MSDC_CFG[1] CARD_CK_PWDN.
3	**PIO**	PIO_MODE	**MS/SD PIO mode** Selects PIO mode. Default: PIO mode
2	**RST**	RST	**Software reset** Writing 1 to this register will cause internal synchronous reset of

MEDIATEK CONFIDENTIAL

Bit(s)	Mnemonic	Name	Description
			MS/SD controller, and it will not reset register settings and DMA controller. The reset sequence is done when this bit becomes 0. SW should wait for this bit to return to 0 after writing 1. 1'b0: MS/SD controller is not in reset state. 1'b1: MS/SD controller is in reset state.
1	**CCKPD**	CARD_CK_PWDN	**MSDC bus clock power-down mode** Controls card clock power-down mode 1'b0: Clock is gated to 0 if no command or data is transmitted. 1'b1: Clock is free running even if no command or data is transmitted. (The clock may still be stopped when MSDC write data are not enough or no space for the next read data.)
0	**MSDC**	MSDC	**Selects MS/SD mode** Configures the controller to be the host of memory stick or host of SD/MMC memory card. The default value is configuring the controller as the host of memory stick. 1'b0: Configure controller to be host of memory stick 1'b1: Configure controller to be host of SD/MMC memory card

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	**CDDBCE**														**CDSTS**	**CDEN**
Type	RW														RU	RW
Reset	0	0	0	0											1	0

Bit(s)	Mnemonic	Name	Description
31	**SDWP**	SD_WP	**Write Protection switch status on SD memory card** Shows the status of Write Protection switch on SD memory card. There is no default reset value. The pin WP (Write Protection) is only useful when the controller is configured for SD memory card. 1'b0: Write Protection switch on, i.e. memory card will be write-protected. 1'b1: Write Protection switch off, i.e. memory card is writable.
24	**CMD**	CMD	**Command line status** Reflects the command line value of MSDC bus.
23:16	**DAT**	DAT	**Data line status** Reflects the data line value of MSDC bus (8-bit).
15:12	**CDDBCE**	CDDEBOUNCE	**Card detection de-bounce timer** Specifies the time interval for card detection de-bounce. Default value: 0, meaning the de-bounce interval is one 32kHz cycle. The interval will extend one cycle time of 32kHz by increasing the counter by 1.

Bit(s)	Mnemonic	Name	Description
22	**AC53FAIL**	AUTOCMD53_FAIL	**SD auto command 53 status register** When auto-command 53 tuning sequence fails , this register will be set to 1 by HW.
21	**AC53DONE**	AUTOCMD53_DONE	**SD auto command 53 status register** When auto-command 53 tuning sequence is finished, this register will be set to 1 by HW.
20	**GEAROUTBOUND**	GEAR_OUT_BOUND	**The gear setting of delay line is out of boundary in the process of SDIO Autocmd 53 On-Line tuning**
19	**DMAPROTECT**	DMA_PROTECT	**There is write operation to DMA start address, length, start bit or the last BUF bit.**
18	**GPDCSERR**	GPD_CS_ERR	**GPD checksum error detected**
17	**BDCSERR**	BD_CS_ERR	**BD checksum error detected**
16	**AC19DONE**	AUTOCMD19_DONE	**SD auto command 19 status register** When auto-command 19 is enabled, HW will clear this register to 0. As the tuning sequence is finished (32 times), this register will be set to 1 by HW. SW should check AUTOCMD_STS0 and SUTOCMD_STS1 only when this bit is on.
15	**SDDCRCERR**	SD_DATA_CRCERR	1'b0: Otherwise 1'b1: MS/SD controller detects a CRC error after reading a block of data from the DAT line or SD/MMC signals a CRC error after writing a block of data to the DAT line.
14	**SDDTO**	SD_DATTO	
13	**DMAXFDNE**	DMA_XFER_DONE	**DMA transfer done interrupt** Indicates status of data block transfer. 1'b0: Otherwise 1'b1: A data block is successfully transferred.
12	**SDXFCPL**	SD_XFER_COMPL	**SD data transfer completed interrupt**

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Mnemonic	Name	Description
		ETE	Indicates transaction which contains data that are completed. While performing tuning procedure (Execute Tuning is set to 1), SD_XFER_COMPLETE is not set to 1.
11	**SDCSTS**	SD_CSTS	**SD CSTA update interrupt** Indicates any bit in register SDC_CSTA is active. The register bit will be set to 1. SW should clear SDC_CSTA, and this bit will be de-asserted automatically.
10	**SDRCRCER**	SD_RESP_CRCERR	**SD command CRC error interrupt** Indicates SD/MMC controller detects a CRC error after reading a response from the CMD line. 1'b0: Otherwise 1'b1: SD/MMC controller detects a CRC error after reading a response from the CMD line.
9	**SDCTO**	SD_CMDTO	**SD command time-out interrupt** Indicates SD/MMC controller detects a time-out condition while waiting for a response on the CMD line. 1'b0: Otherwise 1'b1: SD/MMC controller detects a time-out condition while waiting for a response on the CMD line.
8	**SDCRDY**	SD_CMDRDY	**SD command ready interrupt** For the command without response, the register bit will be 1 once the command is completed on SD/MMC bus. For command with response without busy, the register bit will be 1 whenever the command is issued onto SD/MMC bus and its corresponding response is received without CRC error. For command with response with busy in DAT0, the register bit will be 1 whenever the command is issued onto SD/MMC bus and its corresponding response is received without CRC error and the DAT0 transited from busy to idle. 1'b0: Otherwise 1'b1: Command finished successfully without CRC error.
7	**SDIOIRQ**	SD_SDIOIRQ	**SD SDIO interrupt** Indicates the interrupt is sensed in the SDIO bus. 1'b0: No interrupt on SDIO bus 1'b1: Interrupt on SDIO bus
6	**DMAQEPTY**	DMA_Q_EMPTY	**DMA queue empty interrupt** Indicates the current DMA queue is empty. Only for descriptor mode and enhance mode.
5	**SDACDRCRCER**	SD_AUTOCMD_RESP_CRCERR	**SD auto command CRC error interrupt** Set when detecting a CRC error in the auto command response.
4	**SDACDCTO**	SD_AUTOCMD_CMDTO	**SD auto command time-out interrupt** Set if no response is returned within a specified cycles (64T in spec) from the end bit of auto command.
3	**SDACDCRDY**	SD_AUTOCMD_CMDRDY	**SD auto command ready interrupt** Set if auto command is executed without CRC error or timeout.
1	**MSDCCDSC**	MSDC_CDSC	**MSDC card detection status change interrupt** Indicates if any interrupt for memory card insertion/removal exists. Whenever memory card is inserted or removed and card detection circuit is enabled, i.e. register bit CDEN in register MSDC_PS is set to 1, the register bit will be set to 1. It will be reset when the register is read. 1'b0: Otherwise 1'b1: Card is inserted or removed.
0	**MMCIRQ**	MMC_IRQ	**MMC card interrupt** 1'b0: Otherwise 1'b1: MMC card interrupt event occurs.

Name															ENWKUPINS	ENWKUPSDIOINT
Type															RW	RW
Reset															0	0

Bit(s)	Mnemonic	Name	Description
31:24	**DTOC**	DTOC	**Data timeout counter** The period from the end of the initial host read command or the last read data block in a multiple block read operation to the start bit of the next read data block requires at least two serial clock cycles. The counter is used to extend the period (Read Data Access Time) in unit of 1,048,576 serial clocks. 8'b00000000: Extend 1,048,576 more serial clock cycles 8'b00000001: Extend 1,048,576*2 more serial clock cycles 8'b00000010: Extend 1,048,576*3 more serial clock cycles 8'b11111111: Extend 1,048,576*256 more serial clock cycles
21	**INTBGP**	INT_AT_BLOCK_GAP	**Interrupt at block gap** This bit is valid only in 4-bit mode of the SDIO card and selects a sample point in the interrupt cycle. Set to 1 will enable interrupt detection at the block gap for a multiple block transfer. Set to 0 will disable interrupt detection during a multiple block transfer. If the SD card cannot signal an interrupt during a multiple block transfer, this bit should be set to 0. When the host driver detects an SD card insertion, it will set up this bit according to CCCR of the SDIO card. 1'b0: Disable interrupt detection at block gap 1'b1: Enable interrupt detection at block gap
20	**SDIOIDE**	SDIO_INT_DET_EN	**Enables SDIO interrupt detection** Informs SD controller to sense SDIO interrupt. 1'b0: Disable SDIO interrupt detection 1'b1: Enable SDIO interrupt detection if SDIO bit is also on
19	**SDIO**	SDIO	**SDIO mode enable bit** Enables support to sense SDIO interrupt and disables R4 response CRC check for SDIO card. 1'b0: Disable SDIO mode 1'b1: Enable SDIO mode
17:16	**BUSWD**	BUSWIDTH	**Configures bus width** Defines SD/MMC bus width. 2'b00: 1-bit mode 2'b01: 4-bit mode 2'b10: 8-bit mode 2'b11: Reserved
1	**ENWKUPINS**	WAKEUP_INS_EN	**Card status change wakeup event enable bit** 1'b0: Disable wakeup event for card status change 1'b1: Enable wakeup event for card status change
0	**ENWKUPSDIOINT**	WAKEUP_SDIOINT_EN	**SDIO card interrupt wakeup event enable bit** 1'b0: Disable wakeup event for SDIO card interrupt 1'b1: Enable wakeup event for SDIO card interrupt

11240034 **SDC_CMD** **SD Command Register** **00000000**

Name	ACMD53	VOLSWTH	ACMD		LEN											
Type	RW	RW	RW		RW											
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	GOIRQ	STOP	RW	DTYPE			RSPTYP			BREAK	CMD					
Type	RW	RW	RW	RW			RW			RW	RW					
Reset	0	0	0	0	0		0	0	0	0	0	0	0	0	0	0

Bit(s)	Mnemonic	Name	Description
31	**ACMD53**	AUTO_CMD53	**Enables auto command 53** Should be used exclusively with AUTO_CMD, meaning AUTO_CMD != 2'b00. This field should be assigned to 1'b0. If this filed is assigned to 1'b1, AUTO_CMD should be set to 2'b00. 1'b0: Disable Auto Command 53 1'b1: Enable Auto Command 53
30	**VOLSWTH**	VOL_SWTH	**Voltage switch command** 1'b0: Disable voltage switch detection 1'b1: Enable voltage switch detection
29:28	**ACMD**	AUTO_CMD	**Enables auto command** Determines use of auto command functions. This function can be used in all modes including PIO/Basic DMA/Descriptor DMA/Enhanced Mode. There are two methods to stop multiple-block read and write operation. 1. Enabling auto CMD12 Multiple-block read and write commands for memory require CMD12 to stop the operation. When ACMD-12 is used, MSDC issues CMD12 automatically when the last block transfer is completed. Auto CMD12 error is indicated to the MSDC_INT register. The host driver shall not set up this bit if the command does not require CMD12. In particular, secure commands defined in the Part 3 File Security specification do not require CMD12. 2. Enabling auto CMD23 When ACMD-23 is used, MSDC issues a CMD23 automatically before issuing a command specified in the CMD field. The Host Controller Version 3.00 and later versions support this function. By writing the command register, MSDC issues a CMD23 first then a command specified by the CMD field in the SDC_CMD register. If response errors of CMD23 are detected, the second command will not be issued. A CMD23 error is indicated in the MSDC_INT register. 32-bit block count value for CMD23 is set to the SDC_BLOCK_NUM register. 2'b00: Disable Auto Command 2'b01: Enable Auto CMD12 2'b10: Enable Auto CMD23 2'b11: Enable Re-tuning CMD19
27:16	**LEN**	LEN	**Length** Defines the length of one block (unit: byte) in a data transaction of block mode or the data length (unit: byte) in data transaction of byte mode. The maximum value of block length is 2,048 bytes. 12'b000000000000: Reserved 12'b000000000001: Block length is 1 byte 12'b000000000010: Block length is 2 byte 12'b011111111111: Block length is 2047 byte 12'b100000000000: Block length is 2048 byte
15	**GOIRQ**	GO_IRQ	**GO_IRQ command** Indicates if the command is GO_IRQ_STATE (CMD40) and used only for MMC protocol. If the command is GO_IRQ_STATE, the period between command token and response token will not be

MEDIATEK CONFIDENTIAL

Bit(s)	Mnemonic	Name	Description
			limited. 1'b0: The command is not GO_IRQ_STATE 1'b1: The command is GO_IRQ_STATE
14	**STOP**	STOP	**Stop command** Indicates if the command is a stop transmission command. It should be set to 1 when CMD12 (SD/MMC) or CMD52 with I/O abort (SDIO) is to be issued. 1'b0: The command is not a stop transmission command 1'b1: The command is a stop transmission command
13	**RW**	RW	**Selects command read write** The register bit defines the command is a read command or write command. The register bit is valid only when the command causes a transaction with data token. 1'b0: The command is a read command 1'b1: The command is a write command
12:11	**DTYPE**	DTYPE	**Selects data block** Defines data token type for the command. 2'b00: No data token for the command 2'b01: Single block transaction (only available in block mode) 2'b10: Multiple block transaction. (only available in block mode) 2'b11: Stream operation. It only shall be used in MMC protocol. (only available in block mode)
9:7	**RSPTYP**	RSPTYP	**Command response type** 3'b000: This command has no response. 3'b001: The command has R1/R5/R6/R7 response. The response token is 48-bit with CRC check (For SD/MMC/SDIO) (Not include the SDIO abort command) 3'b010: The command has R2 response. The response token is 136-bit (For SD/MMC) 3'b011: The command has R3 response. The response token is 48-bit response, no CRC check (For SD/MMC) 3'b100: The command has R4 response. The response token is 48-bit without CRC check (For SDIO) The response token is 48-bit with CRC check (For MMC) 3'b111: The command has R1b response. The response token is 48-bit (For SD/MMC/SDIO)
6	**BREAK**	BREAK	**Aborts pending MMC GO_IRQ command** Only valid for a pending GO_IRQ_MODE command waiting for MMC interrupt response. 1'b0: Not a beak command 1'b1: Break a pending MMC GO_IRQ_MODE command in the controller.
5:0	**CMD**	CMD	**SD Memory Card command**

Type		RW			RW	RW	RW	RW					RU	WO	A0	WO
Reset		1	1	0	0	0	0	0					1	0	0	0

Bit(s)	Mnemonic	Name	Description
14:12	**BSTSZ**	BURST_SIZE	**DMA burst size** Specifies the maximum transfer bytes allowed at the device per DMA burst. This field cannot be modified when the DMA status is 1. 3'd3: 8 Bytes 3'd4: 16 Bytes 3'd5: 32 Bytes 3'd6: 64 Bytes Other: Reserved
11	**SPLIT1K**	DMA_SPLIT_1K	**Specifies split burst when corssing 1K boundary address** 1'b0: 1K boundary not split 1'b1: 1K boundary split
10	**LASTBF**	LAST_BUF	**Last buffer of the basic DMA mode** Indicates the last buffer in basic DMA mode.
9	**DMAALIGN**	DMA_ALIGN	**Specifies address alignment burst size** 1'b0: do not DAM burst size alignment 1'b1: DAM burst size alignment
8	**DMAMOD**	DMA_MODE	**DMA operation mode** Indicates operation mode of DMA. 1'b0: Basic DMA mode 1'b1: Descriptor base DMA mode
3	**READYM**	AHB_READYM	**Only for debugging when DMA hangs** SW checks if AHB bus is ok when GDMA hangs. 1: bus is normal 0: bus not normal
2	**DMARSM**	DMA_RESUME	**DMA resume control register** Resumes DMA transaction. Read always returns to 0.

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Mnemonic	Name	Description
1	DMASTOP	DMA_STOP	**DMA stop control register** Stops DMA transaction. When SW issues STOP command, SW must wait for this bit to be de-asserted or DMA inactive to guarantee stop is done.
0	DMASTART	DMA_START	**DMA start control register** Starts DMA transaction. Read always returns to 0.

1124009C **DMA_CFG** **DMA Configuration Register** **00000004**

Type	RW	RW					RW			RW	RW	RW	RW	RW	RW	RW
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1

Bit(s)	Mnemonic	Name	Description
31	**PTCH31**	EN_MMC_DRV_RESP	**Enables MSDC always driving bus when outputting wake-up response (BREAK)** 1'b0: Disable 1'b1: Enable
30	**PTCH30**	DETECT_WR_CRC_TIMEOUT	**Detects MSDC write data CRC phase time-out** 1'b0: Does not detect CRC phase timeout 1'b1: Detect CRC phase timeout
29	**PTCH29**	SPC_ALWAYS_PUSH	**SPC buffer push mechanism** 1'b0: Push the buffer only when read transfer is on-going 1'b1: Always push the buffer
28	**PTCH28**	SDIO_INT_DLY_SEL	**Selects SDIO interrupt latch time** 1'b0: Latch the data line value in internal SDIO interrupt period 1'b1: Latch the data line value in 1 clock delay of internal SDIO interrupt period
27	**PTCH27**	SDC_CMD_CMDFAIL_SEL	**Selects SDIO interrupt period recovery** 1'b0: SDIO interrupt period will re-start after a CMD12 or CMD52 command is issued 1'b1: SDIO interrupt period whenever DAT line is not busy
26	**PTCH26**	SDC_CMD_IDRT_SEL	**Selects SD identification response time** The register bit indicates if the command has a response with NID (i.e. 5 serial clock cycles as defined in SD memory card Specification Part 1 Physical Layer Specification version 1.0) response time. The register bit is valid only when the command has a response token. Thus, the register bit must be set to 1 for CMD2 (ALL_SEND_CID) and ACMD41 (SD_APP_OP_CMD). 1'b0: Otherwise. 1'b1: The command has a response with NID response time.
25:22	**PTCH22**	SDC_CFG_WDOD	**SD Write Data Output Delay** The period from finish of the response for the initial host write command or the last write data block in a multiple block write operation to the start bit of the next write data block requires at least two serial clock cycles. The register field is used to extend the period (Write Data Output Delay) in unit of one serial clock. 4'b0000: No extension 4'b0001: Extend 1 more serial clock cycle 4'b0010: Extend 2 more serial clock cycles 4'b1111: Extend 15 more serial clock cycles
21:18	**PTCH18**	SDC_CFG_BSYDLY	**SD R1B busy detection mode**

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Mnemonic	Name	Description
			Only valid for the commands with R1b response. If the command has a response of R1b type, MS/SD controller must monitor the data line 0 for card busy status from the bit time that is two serial clock cycles after the command end bit to check if operations in SD/MMC memory card are finished. The register field is used to expand the time between the command end bit and end of detection period to detect card busy status. If time is up and there is no card busy status on data line 0, the controller will abandon the detection. 4'b0000: No extension 4'b0001: Extend 1 more serial clock cycle 4'b0010: Extend 2 more serial clock cycles 4'b1111: Extend 15 more serial clock cycles
17	**PTCH17**	SDIO_CFG_INTC_SEL	**Selects SDIO interrupt model** 1'b0: When data line [1] = 0, trigger SDIO interrupt event. 1'b1: When data line [3:0] = 4'b1101, trigger SDIO interrupt event
16	**PTCH16**	MSDC_BLKNUM_SEL	**Supports ACMD23 reliable/force pro etc. features** 1'b0: Support ACMD23 reliable/force prog etc. feature 1'b1: Does not support ACMD23 reliable/force prog etc. feature
15	**PTCH15**	MSDC_FIFO_RD_DIS	**Disables MSDC RXFIFO read** 1'b0: Disable FIFO read permission to RXFIFO in PIO mode 1'b1: Enable FIFO read permission to RXFIFO in PIO mode
14:10	**CKGDLYS**	CKGEN_MSDC_DLY_SEL	**Selects CKBUF in CKGEN delay** Total 32 stages.
9:7	**INTCKS**	INT_DAT_LATCH_CK_SEL	**Selects internal MSDC clock phase** Total 8 stages, each stage can delay 1 clock period of msdc_src_ck.
6	**DESCUP**	DESC_UP_SEL	**SD transfer done interrupt should be issued when GPD are updated.** 1'b1: Enable new function to generate SD transfer done interrupt 1'b0: Use old function to generate SD transfer done interrupt
5	**PTCH5**	ACMD53_FAIL_ONE_SHOT	**Determines interrupt method of AUTOCMD53_FAIL** 1'b0: AUTOCMD53_FAIL interrupt will be asserted whenever CMD/DAT CRC error occurs. 1'b1: AUTOCMD53_FAIL interrupt will be asserted only when AUTOCMD53_DONE is asserted if there is CMD/DAT CRC error.
4	**PTCH4**	MASK_ACMD53_CRC_ERR_INTR	**Masks CMD/DAT CRC error interrupt when executing AUTOCMD53 training sequence** 1'b0: Enable CMD/DAT CRC error interrupt when executing AUTOCMD53 training sequence 1'b1: Mask CMD/DAT CRC error interrupt when executing AUTOCMD53 training sequence
3	**PTCH3**	RD_DAT_SEL	**Defines to use rising or falling buf data for SDR mode** 1'b0: Used rising buf data for SDR mode 1'b1: Used falling buf data for SDR mode
2	**PTCH02**	DIS_REFLECT_CMDWR_WHEN_BSY	**Enables SD command register write monitor** 1'b0: Enable monitor function 1'b1: Disable monitor function
1	**PTCH01**	EN_SDC_ODD_8BIT_SUP	**Enables SD odd number support for 8-bit data bus** 1'b0: Disable 1'b1: Enable
0	**PTCH00**	EN_SDC_ODD	**Enables SD odd number support for 8-bit data bus** 1'b0: Disable 1'b1: Enable

Bit(s)	Mnemonic	Name	Description
31:0	**ECOVER**	ECO_VER	ECO version

Module name: MSDC2 Base address: (+11250000h)

Address	Name	Width	Register Function
11250000	MSDC_CFG	32	**MSDC Configuration Register** For general configuration of the MS/SD controller
11250004	MSDC_IOCON	32	**MSDC IO Configuration Register** Contains the receiver path data latch timing control and interface control bits
11250008	MSDC_PS	32	**MSDC Pin Status Register** Stores card detection and write protection pin status. Card detection status can be disabled.
1125000C	MSDC_INT	32	**MSDC Interrupt Register** Contains the status of interrupts Note: The register still shows the status of interrupt even though the interrupt is disabled.
11250010	MSDC_INTEN	32	**MSDC Interrupt Enable Register** Contains related enabling bit of interrupts
11250014	MSDC_FIFOCS	32	**MSDC FIFO Control and Status Register** Contains control and status of embedded 128B FIFO
11250018	MSDC_TXDAT	32	**MSDC TX Data Port Register**

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Address	Name	Width	Register Function
	A		For PIO mode only. Used to input MSDC write data to card. The access can be AHB1B/2B/4B.
1125001C	MSDC_RXDATA	32	**MSDC RX Data Port Register** For PIO mode only. Used to read back MSDC read data from card. The access can be AHB1B/2B/4B.
11250030	SDC_CFG	32	**SD Configuration Register** Configures MS/SD memory card controller when it is configured as the host of SD memory card. If the controller is configured as the host of memory stick, the contents of the register will have no impact on the operation of the controller.
11250034	SDC_CMD	32	**SD Command Register** Defines a SD memory card command and its attributes. Before MS/SD controller issues a transaction onto SD bus, the application should specify other relative settings such as argument for command. After writing the register by the application, MS/SD controller will issue the corresponding transaction onto SD serial bus. If the command is GO_IDLE_STATE, the controller will have serial clock on SD/MMC bus running 128 cycles before issuing the command.
11250038	SDC_ARG	32	**SD Argument Register** Contains argument of SD/MMC memory card command
1125003C	SDC_STS	32	**SD Status Register** Reflects SD bus status and contains MMC stream write status
11250040	SDC_RESP0	32	**SD Response Register 0** Contains parts of the last SD/MMC memory card bus response. See description in register field SDC_RESP3.
11250044	SDC_RESP1	32	**SD Response Register 1** Contains parts of the last SD/MMC memory card bus response. See description in register field SDC_RESP3.
11250048	SDC_RESP2	32	**SD Response Register 2** Contains parts of the last SD/MMC memory card bus response. See description in register field SDC_RESP3.
1125004C	SDC_RESP3	32	**SD Response Register 3** Contains parts of the last SD/MMC memory card bus response. Register fields SDC_RESP0, SDC_RESP1, SDC_RESP2 and SDC_RESP3 are composed of the last SD/MMC memory card bus response. For response of type R2, i.e. response of the command ALL_SEND_CID, SEND_CSD and SEND_CID, only bit 127 to 0 of response token are stored in register field SDC_RESP0, SDC_RESP1, SDC_RESP2 and SDC_RESP3. SDC_RESP0 = bit 31~0 SDC_RESP1 = bit 63~32 SDC_RESP2 = bit 95~64 SDC_RESP3 = bit 127~96 For response of type R1b in auto CMD12 or R1 in auto CMD23, bit 39 to 8 of response token are stored in register field of SDC_RESP3. For the responses of other types, only bit 39 to 8 of response token are stored in the register field SDC_RESP0.
11250050	SDC_BLK_NUM	32	**SD Block Number Register** Defines block number for block transaction. For single read/write, this register should be set to 1. For multiple read/write, this register should be set to bigger than 1. Set to 0 will cause unexpected result.
11250054	SDC_VOL_CHG	32	**SD Voltage Change Wait Time Register** Defines SD voltage change check wait time.
11250058	SDC_CSTS	32	**SD Card Status Register** After commands with R1 and R1b response, this register will contain the status of the SD/MMC card.
1125005C	SDC_CSTS_EN	32	**SD Card Status Enable Register**

This document contains information that is proprietary to MediaTek Inc.

Address	Name	Width	Register Function
			Controls which bit of SDC_CSTS will generate the MSDC_INT.SD_CSTA interrupt
11250060	**SDC_DATCRC_STS**	32	**SD Card Data CRC Status Register** Reflects CRC status of data line[7:0]. Only for MSDC read.
11250080	**SD_ACMD_RESP**	32	**SD ACMD Response Register** Stores response of auto command from SD card
11250084	**SD_ACMD19_TRG**	32	**SD ACMD19 Target Register** Selects target delay line to run ACMD19 sequence
11250088	**SD_ACMD19_STS**	32	**SD ACMD19 Status Register** Stores result of auto command 19 from SD card
1125008C	**DMA_SA_HIGH4BIT**	32	**DMA Current Address Register of high 4bit** Contains start address high 4 bits of the 36-bit address for 64G DRAM access
11250090	**DMA_SA**	32	**DMA Start Address Register** Contains start address of DMA descriptor
11250094	**DMA_CA**	32	**DMA Current Address Register** Contains current DMA address
11250098	**DMA_CTRL**	32	**DMA Control Register** Controls DMA operation
1125009C	**DMA_CFG**	32	**DMA Configuration Register** Configures DMA operation
112500A0	**SW_DBG_SEL**	32	**MSDC S/W Debug Selection Register** Selects SW debugging output
112500A4	**SW_DBG_OUT**	32	**MSDC S/W Debug Output Register** Shows selected debugging output
112500A8	**DMA_LENGTH**	32	**DMA Length Register** Sets up basic DMA operation length
112500B0	**PATCH_BIT0**	32	**MSDC Patch Bit Register 0** Configures patch function. For normal function, this bit should be kept at default value.
112500B4	**PATCH_BIT1**	32	**MSDC Patch Bit Register 1** Configures patch function. For normal function, this bit should be kept at default value.
112500B8	**PATCH_BIT2**	32	**MSDC Patch Bit Register 2** Configures patch function. For normal function, this bit should be kept at default value.
112500C0	**DAT0_TUNE_CRC**	32	**DAT0 Tune Result Register** Records on-line tuning result for DAT0 line
112500C4	**DAT1_TUNE_CRC**	32	**DAT1 Tune Result Register** Records on-line tuning result for DAT1 line
112500C8	**DAT2_TUNE_CRC**	32	**DAT2 Tune Result Register** Records on-line tuning result for DAT2 line
112500CC	**DAT3_TUNE_CRC**	32	**DAT3 Tune Result Register** Records on-line tuning result for DAT3 line
112500D0	**CMD_TUNE_CRC**	32	**CMD Tune Result Register** Records on-line tuning result for CMD line
112500D4	**SDIO_TUNE_WIND**	32	**SDIO Tune Window Register 0** Defines tuning window size for SDIO on-line CRC tuning feature
112500F0	**PAD_TUNE0**	32	**MSDC Pad Tuning Register 0** Configures delay line embedded in pad macro
112500F4	**PAD_TUNE1**	32	**MSDC Pad Tuning Register 1** Configures delay line embedded in pad macro

Address	Name	Width	Register Function
112500F8	DAT_RD_DLY0	32	**MSDC Data Delay Line Register 0** Configures delay line embedded in pad macro
112500FC	DAT_RD_DLY1	32	**MSDC Data Delay Line Register 1** Configures delay line embedded in pad macro
11250100	DAT_RD_DLY2	32	**MSDC Data Delay Line Register 2** Configures delay line embedded in pad macro
11250104	DAT_RD_DLY3	32	**MSDC Data Delay Line Register 3** Configures delay line embedded in pad macro
11250110	HW_DBG_SEL	32	**MSDC H/W Debug Selection Register** Selects HW debug output
11250114	MAIN_VER	32	**MSDC Main Version Register** Shows the version code of MSDC IP
11250118	ECO_VER	32	**MSDC ECO Version Register** Shows the ECO version code of MSDC IP

11250000 MSDC_CFG MSDC Configuration Register 02000099

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name							SCLK STOP SEL				CCKMD		CCKDIV[11:8]			
Type							RW				RW		RW			
Reset							1				0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	CCKDIV[7:0]								CCKSB	BV18PSS	BV18SDT	CCKDRVE	PIO	RST	CCKPD	MSDC
Type	RW								RU	RU	RW	RW	RW	A0	RW	RW
Reset	0	0	0	0	0	0	0	0	1	0	0	1	1	0	0	1

Bit(s)	Mnemonic	Name	Description
25	SCLKSTOP SEL	SCLK_STOP_SEL	**In DDR mode, stops SCLK when device is idle whether checking SCLK phase or not** 1'b0: Stop sclk not checking SCLK phase 1'b1: Stop sclk checking SCLK phase; fix 1/4T sclk glitch in DDR mode
21:20	CCKMD	CARD_CK_MODE	**MS/SD card clock mode** 2'b00: Use clock divider output divided by msdc_src_ck as msdc_ck. bit[15]~bit[8] should be programmed. 2'b01: Use msdc_src_ck as msdc_ck. bit[15]~bit[8] is ignored. 2'b10: DDR mode; use clock divider output divided by msdc_src_ck as msdc_ck. bit[15]~bit[8] should be programmed. 2'b11: HS400 mode; use clock divider output and use msdc_src_ck as msdc_ck. bit[15]~bit[8] should be programmed.
19:8	CCKDIV	CARD_CK_DIV	**MS/SD card clock divider** Controls clock frequency of serial clock on MS/SD bus. Refer to "Data Line Latching Timing Diagram" and "Response Latching Timing Diagram". For non-DDR mode, msdc_ck equals SD bus clock. (Example: For SDR25 or HS, msdc_ck and SD bus clock will be 50MHz) For DDR mode, msdc_ck denotes MSDC internal clock which will be doubled to SD bus clock. (Example: For DDR50, msdc_ck should be set to 100MHz, and bus clock will be 50MHz.) 8'b00000000: msdc_ck =(1/2)*msdc_src_ck 8'b00000001: msdc_ck = [1/(4*1)]*msdc_src_ck 8'b00000010: msdc_ck = [1/(4*2)]*msdc_src_ck 8'b00000011: msdc_ck = [1/(4*3)]*msdc_src_ck 8'b00010000: msdc_ck = [1/(4*16)]*msdc_src_ck

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.

Bit(s)	Mnemonic	Name	Description
			8'b11111111: msdc_ck = [1/(4*255)]*msdc_src_ck
7	**CCKSB**	CARD_CK_STABLE	**MS/SD card clock is stable or not** After programming CARD_CK_MODE or CARD_CK_DIV, this bit will immediately become 0 and return to 1 if stable. Poll this register to ensure safety control of MSDC. 1'b0: Clock output is not stable. 1'b1: Clock output is stable.
6	**BV18PSS**	BV_1P8_PASS	**MSDC bus voltage 1.8V detection status** SW should check this bit after BUS_VOL_18V_START_DET turns to 0 from 1. 1'b0: Error in voltage detection 1'b1: No error in voltage detection
5	**BV18SDT**	BV_1P8_START_DET	**MSDC bus voltage 1.8V detection sequence start event** SW writes 1 to this bit to trigger HW outputting 1.8V clock for 1ms and automatically detecting CMD/DAT line sequence for voltage change is passed or not. HW will clear this bit to 0 after the detection is finished. The passed or failed status is stored in bit[6] BUS_VOL_18V_PASS.
4	**CCKDRVE**	CARD_CK_DRV_EN	**SD/MS card bus clock drive enable bit** Set this bit to 1 to enable MSDC bus clock driver. The default bus state depends on MSDC_CFG][1] CARD_CK_PWDN bit. If MSDC_CFG[1] CARD_CK_PWDN=1, the default clock state will be free running. If MSDC_CFG[1] CARD_CK_PWDN=0, the default clock state will be gated to 0. Set this bit to 0 will put the bus state into "tri-state". Default: 1 1'b0: Put the clock pad into tri-state 1'b1: Enable MSDC to drive clock pad. The state of CLK depends on MSDC_CFG[1] CARD_CK_PWDN.
3	**PIO**	PIO_MODE	**MS/SD PIO mode** Selects PIO mode. Default: PIO mode
2	**RST**	RST	**Software reset** Writing 1 to this register will cause internal synchronous reset of MS/SD controller, and it will not reset register settings and DMA controller. The reset sequence is done when this bit becomes 0. SW should wait for this bit to return to 0 after writing 1. 1'b0: MS/SD controller is not in reset state. 1'b1: MS/SD controller is in reset state.
1	**CCKPD**	CARD_CK_PWDN	**MSDC bus clock power-down mode** Controls card clock power-down mode 1'b0: Clock is gated to 0 if no command or data is transmitted. 1'b1: Clock is free running even if no command or data is transmitted. (The clock may still be stopped when MSDC write data are not enough or no space for the next read data.)
0	**MSDC**	MSDC	**Selects MS/SD mode** Configures the controller to be the host of memory stick or host of SD/MMC memory card. The default value is configuring the controller as the host of memory stick. 1'b0: Configure controller to be host of memory stick 1'b1: Configure controller to be host of SD/MMC memory card

11250008 MSDC_PS MSDC Pin Status Register 01FF0002

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	SDWP							CMD	DAT							
Type	RU							RU	RU							
Reset	0							1	1	1	1	1	1	1	1	1
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	CDDBCE														CDSTS	CDEN
Type	RW														RU	RW
Reset	0	0	0	0											1	0

Bit(s)	Mnemonic	Name	Description
31	**SDWP**	SD_WP	**Write Protection switch status on SD memory card** Shows the status of Write Protection switch on SD memory card. There is no default reset value. The pin WP (Write Protection) is only useful when the controller is configured for SD memory card. 1'b0: Write Protection switch on, i.e. memory card will be write-protected. 1'b1: Write Protection switch off, i.e. memory card is writable.
24	**CMD**	CMD	**Command line status** Reflects the command line value of MSDC bus.
23:16	**DAT**	DAT	**Data line status** Reflects the data line value of MSDC bus (8-bit).
15:12	**CDDBCE**	CDDEBOUNCE	**Card detection de-bounce timer** Specifies the time interval for card detection de-bounce. Default value: 0, meaning the de-bounce interval is one 32kHz cycle. The interval will extend one cycle time of 32kHz by increasing the counter by 1.
1	**CDSTS**	CDSTS	**Card detection status** 1'b0: Card detection pin status is logic low. 1'b1: Card detection pin status is logic high.
0	**CDEN**	CDEN	**Enables card detection** Controls the card detection circuit. 1'b0: Disable card detection 1'b1: Enable card detection

1125000C MSDC_INT MSDC Interrupt Register 00000000

Bit(s)	Mnemonic	Name	Description
22	**AC53FAIL**	AUTOCMD53_FAIL	**SD auto command 53 status register** When auto-command 53 tuning sequence fails , this register will be set to 1 by HW.
21	**AC53DONE**	AUTOCMD53_DONE	**SD auto command 53 status register** When auto-command 53 tuning sequence is finished, this register will be set to 1 by HW.
20	**GEAROUTBOUND**	GEAR_OUT_BOUND	**The gear setting of delay line is out of boundary in the process of SDIO Autocmd 53 On-Line tuning**
19	**DMAPROTECT**	DMA_PROTECT	**There is write operation to DMA start address, length, start bit or the last BUF bit.**
18	**GPDCSERR**	GPD_CS_ERR	**GPD checksum error detected**
17	**BDCSERR**	BD_CS_ERR	**BD checksum error detected**
16	**AC19DONE**	AUTOCMD19_DONE	**SD auto command 19 status register** When auto-command 19 is enabled, HW will clear this register to 0. As the tuning sequence is finished (32 times), this register will be set to 1 by HW. SW should check AUTOCMD_STS0 and SUTOCMD_STS1 only when this bit is on.
15	**SDDCRCERR**	SD_DATA_CRCERR	1'b0: Otherwise 1'b1: MS/SD controller detects a CRC error after reading a block of data from the DAT line or SD/MMC signals a CRC error after writing a block of data to the DAT line.
14	**SDDTO**	SD_DATTO	
13	**DMAXFDNE**	DMA_XFER_DONE	**DMA transfer done interrupt** Indicates status of data block transfer. 1'b0: Otherwise 1'b1: A data block is successfully transferred.
12	**SDXFCPL**	SD_XFER_COMPLETE	**SD data transfer completed interrupt** Indicates transaction which contains data that are completed. While performing tuning procedure (Execute Tuning is set to 1), SD_XFER_COMPLETE is not set to 1.
11	**SDCSTS**	SD_CSTS	**SD CSTA update interrupt** Indicates any bit in register SDC_CSTA is active. The register bit will be set to 1. SW should clear SDC_CSTA, and this bit will be de-asserted automatically.
10	**SDRCRCER**	SD_RESP_CRCERR	**SD command CRC error interrupt** Indicates SD/MMC controller detects a CRC error after reading a response from the CMD line. 1'b0: Otherwise 1'b1: SD/MMC controller detects a CRC error after reading a response from the CMD line.
9	**SDCTO**	SD_CMDTO	**SD command time-out interrupt** Indicates SD/MMC controller detects a time-out condition while waiting for a response on the CMD line. 1'b0: Otherwise 1'b1: SD/MMC controller detects a time-out condition while waiting for a response on the CMD line.
8	**SDCRDY**	SD_CMDRDY	**SD command ready interrupt** For the command without response, the register bit will be 1 once the command is completed on SD/MMC bus. For command with response without busy, the register bit will be 1 whenever the command is issued onto SD/MMC bus and its corresponding response is received without CRC error. For command with response with busy in DAT0, the register bit will be 1 whenever the command is issued onto SD/MMC bus and its

MEDIATEK CONFIDENTIAL

Bit(s)	Mnemonic	Name	Description
			corresponding response is received without CRC error and the DAT0 transited from busy to idle. 1'b0: Otherwise 1'b1: Command finished successfully without CRC error.
7	**SDIOIRQ**	SD_SDIOIRQ	**SD SDIO interrupt** Indicates the interrupt is sensed in the SDIO bus. 1'b0: No interrupt on SDIO bus 1'b1: Interrupt on SDIO bus
6	**DMAQEPTY**	DMA_Q_EMPTY	**DMA queue empty interrupt** Indicates the current DMA queue is empty. Only for descriptor mode and enhance mode.
5	**SDACDRCRCER**	SD_AUTOCMD_RESP_CRCERR	**SD auto command CRC error interrupt** Set when detecting a CRC error in the auto command response.
4	**SDACDCTO**	SD_AUTOCMD_CMDTO	**SD auto command time-out interrupt** Set if no response is returned within a specified cycles (64T in spec) from the end bit of auto command.
3	**SDACDCRDY**	SD_AUTOCMD_CMDRDY	**SD auto command ready interrupt** Set if auto command is executed without CRC error or timeout.
1	**MSDCCDSC**	MSDC_CDSC	**MSDC card detection status change interrupt** Indicates if any interrupt for memory card insertion/removal exists. Whenever memory card is inserted or removed and card detection circuit is enabled, i.e. register bit CDEN in register MSDC_PS is set to 1, the register bit will be set to 1. It will be reset when the register is read. 1'b0: Otherwise 1'b1: Card is inserted or removed.
0	**MMCIRQ**	MMC_IRQ	**MMC card interrupt** 1'b0: Otherwise 1'b1: MMC card interrupt event occurs.

11250010 **MSDC_INTEN** **MSDC Interrupt Enable Register** **00000000**

Type															RW	RW
Reset															0	0

Bit(s)	Mnemonic	Name	Description
31:24	**DTOC**	DTOC	**Data timeout counter** The period from the end of the initial host read command or the last read data block in a multiple block read operation to the start bit of the next read data block requires at least two serial clock cycles. The counter is used to extend the period (Read Data Access Time) in unit of 1,048,576 serial clocks. 8'b00000000: Extend 1,048,576 more serial clock cycles 8'b00000001: Extend 1,048,576*2 more serial clock cycles 8'b00000010: Extend 1,048,576*3 more serial clock cycles 8'b11111111: Extend 1,048,576*256 more serial clock cycles
21	**INTBGP**	INT_AT_BLOCK_GAP	**Interrupt at block gap** This bit is valid only in 4-bit mode of the SDIO card and selects a sample point in the interrupt cycle. Set to 1 will enable interrupt detection at the block gap for a multiple block transfer. Set to 0 will disable interrupt detection during a multiple block transfer. If the SD card cannot signal an interrupt during a multiple block transfer, this

MEDIATEK CONFIDENTIAL

Bit(s)	Mnemonic	Name	Description
			bit should be set to 0. When the host driver detects an SD card insertion, it will set up this bit according to CCCR of the SDIO card. 1'b0: Disable interrupt detection at block gap 1'b1: Enable interrupt detection at block gap
20	**SDIOIDE**	SDIO_INT_DET_EN	**Enables SDIO interrupt detection** Informs SD controller to sense SDIO interrupt. 1'b0: Disable SDIO interrupt detection 1'b1: Enable SDIO interrupt detection if SDIO bit is also on
19	**SDIO**	SDIO	**SDIO mode enable bit** Enables support to sense SDIO interrupt and disables R4 response CRC check for SDIO card. 1'b0: Disable SDIO mode 1'b1: Enable SDIO mode
17:16	**BUSWD**	BUSWIDTH	**Configures bus width** Defines SD/MMC bus width. 2'b00: 1-bit mode 2'b01: 4-bit mode 2'b10: 8-bit mode 2'b11: Reserved
1	**ENWKUPINS**	WAKEUP_INS_EN	**Card status change wakeup event enable bit** 1'b0: Disable wakeup event for card status change 1'b1: Enable wakeup event for card status change
0	**ENWKUPSDIOINT**	WAKEUP_SDIOINT_EN	**SDIO card interrupt wakeup event enable bit** 1'b0: Disable wakeup event for SDIO card interrupt 1'b1: Enable wakeup event for SDIO card interrupt

11250034 SDC_CMD SD Command Register 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	ACMD53	VOLSWTH	ACMD		LEN											
Type	RW	RW	RW		RW											
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	GOIRQ	STOP	RW	DTYPE			RSPTYP			BREAK	CMD					
Type	RW	RW	RW	RW			RW			RW	RW					
Reset	0	0	0	0	0		0	0	0	0	0	0	0	0	0	0

Bit(s)	Mnemonic	Name	Description
31	**ACMD53**	AUTO_CMD53	**Enables auto command 53** Should be used exclusively with AUTO_CMD, meaning AUTO_CMD != 2'b00. This field should be assigned to 1'b0. If this filed is assigned to 1'b1, AUTO_CMD should be set to 2'b00. 1'b0: Disable Auto Command 53 1'b1: Enable Auto Command 53
30	**VOLSWTH**	VOL_SWTH	**Voltage switch command** 1'b0: Disable voltage switch detection 1'b1: Enable voltage switch detection
29:28	**ACMD**	AUTO_CMD	**Enables auto command** Determines use of auto command functions. This function can be used in all modes including PIO/Basic DMA/Descriptor DMA/Enhanced Mode. There are two methods to stop multiple-block read and write operation.

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Mnemonic	Name	Description
			1. Enabling auto CMD12 Multiple-block read and write commands for memory require CMD12 to stop the operation. When ACMD-12 is used, MSDC issues CMD12 automatically when the last block transfer is completed. Auto CMD12 error is indicated to the MSDC_INT register. The host driver shall not set up this bit if the command does not require CMD12. In particular, secure commands defined in the Part 3 File Security specification do not require CMD12. 2. Enabling auto CMD23 When ACMD-23 is used, MSDC issues a CMD23 automatically before issuing a command specified in the CMD field. The Host Controller Version 3.00 and later versions support this function. By writing the command register, MSDC issues a CMD23 first then a command specified by the CMD field in the SDC_CMD register. If response errors of CMD23 are detected, the second command will not be issued. A CMD23 error is indicated in the MSDC_INT register. 32-bit block count value for CMD23 is set to the SDC_BLOCK_NUM register. 2'b00: Disable Auto Command 2'b01: Enable Auto CMD12 2'b10: Enable Auto CMD23 2'b11: Enable Re-tuning CMD19
27:16	**LEN**	LEN	**Length** Defines the length of one block (unit: byte) in a data transaction of block mode or the data length (unit: byte) in data transaction of byte mode. The maximum value of block length is 2,048 bytes. 12'b000000000000: Reserved 12'b000000000001: Block length is 1 byte 12'b000000000010: Block length is 2 byte 12'b011111111111: Block length is 2047 byte 12'b100000000000: Block length is 2048 byte
15	**GOIRQ**	GO_IRQ	**GO_IRQ command** Indicates if the command is GO_IRQ_STATE (CMD40) and used only for MMC protocol. If the command is GO_IRQ_STATE, the period between command token and response token will not be limited. 1'b0: The command is not GO_IRQ_STATE 1'b1: The command is GO_IRQ_STATE
14	**STOP**	STOP	**Stop command** Indicates if the command is a stop transmission command. It should be set to 1 when CMD12 (SD/MMC) or CMD52 with I/O abort (SDIO) is to be issued. 1'b0: The command is not a stop transmission command 1'b1: The command is a stop transmission command
13	**RW**	RW	**Selects command read write** The register bit defines the command is a read command or write command. The register bit is valid only when the command causes a transaction with data token. 1'b0: The command is a read command 1'b1: The command is a write command
12:11	**DTYPE**	DTYPE	**Selects data block** Defines data token type for the command. 2'b00: No data token for the command 2'b01: Single block transaction (only available in block mode) 2'b10: Multiple block transaction. (only available in block mode) 2'b11: Stream operation. It only shall be used in MMC protocol. (only available in block mode)
9:7	**RSPTYP**	RSPTYP	**Command response type** 3'b000: This command has no response. 3'b001: The command has R1/R5/R6/R7 response. The response

This document contains information that is proprietary to MediaTek Inc.

Bit(s)	Mnemonic	Name	Description
			token is 48-bit with CRC check (For SD/MMC/SDIO) (Not include the SDIO abort command) 3'b010: The command has R2 response. The response token is 136-bit (For SD/MMC) 3'b011: The command has R3 response. The response token is 48-bit response, no CRC check (For SD/MMC) 3'b100: The command has R4 response. The response token is 48-bit without CRC check (For SDIO) The response token is 48-bit with CRC check (For MMC) 3'b111: The command has R1b response. The response token is 48-bit (For SD/MMC/SDIO)
6	**BREAK**	BREAK	**Aborts pending MMC GO_IRQ command** Only valid for a pending GO_IRQ_MODE command waiting for MMC interrupt response. 1'b0: Not a beak command 1'b1: Break a pending MMC GO_IRQ_MODE command in the controller.
5:0	**CMD**	CMD	**SD Memory Card command**

Type	RW	RW					RW			RW	RW	RW	RW	RW	RW	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	

Bit(s)	Mnemonic	Name	Description
31	**PTCH31**	EN_MMC_DRV_RESP	**Enables MSDC always driving bus when outputting wake-up response (BREAK)** 1'b0: Disable 1'b1: Enable
30	**PTCH30**	DETECT_WR_CRC_TIMEOUT	**Detects MSDC write data CRC phase time-out** 1'b0: Does not detect CRC phase timeout 1'b1: Detect CRC phase timeout
29	**PTCH29**	SPC_ALWAYS_PUSH	**SPC buffer push mechanism** 1'b0: Push the buffer only when read transfer is on-going 1'b1: Always push the buffer
28	**PTCH28**	SDIO_INT_DLY_SEL	**Selects SDIO interrupt latch time** 1'b0: Latch the data line value in internal SDIO interrupt period 1'b1: Latch the data line value in 1 clock delay of internal SDIO interrupt period
27	**PTCH27**	SDC_CMD_CMDFAIL_SEL	**Selects SDIO interrupt period recovery** 1'b0: SDIO interrupt period will re-start after a CMD12 or CMD52 command is issued 1'b1: SDIO interrupt period whenever DAT line is not busy
26	**PTCH26**	SDC_CMD_IDRT_SEL	**Selects SD identification response time** The register bit indicates if the command has a response with NID (i.e. 5 serial clock cycles as defined in SD memory card Specification Part 1 Physical Layer Specification version 1.0) response time. The register bit is valid only when the command has a response token.

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Mnemonic	Name	Description
			Thus, the register bit must be set to 1 for CMD2 (ALL_SEND_CID) and ACMD41 (SD_APP_OP_CMD). 1'b0: Otherwise. 1'b1: The command has a response with NID response time.
25:22	**PTCH22**	SDC_CFG_WDOD	**SD Write Data Output Delay** The period from finish of the response for the initial host write command or the last write data block in a multiple block write operation to the start bit of the next write data block requires at least two serial clock cycles. The register field is used to extend the period (Write Data Output Delay) in unit of one serial clock. 4'b0000: No extension 4'b0001: Extend 1 more serial clock cycle 4'b0010: Extend 2 more serial clock cycles 4'b1111: Extend 15 more serial clock cycles
21:18	**PTCH18**	SDC_CFG_BSYDLY	**SD R1B busy detection mode** Only valid for the commands with R1b response. If the command has a response of R1b type, MS/SD controller must monitor the data line 0 for card busy status from the bit time that is two serial clock cycles after the command end bit to check if operations in SD/MMC memory card are finished. The register field is used to expand the time between the command end bit and end of detection period to detect card busy status. If time is up and there is no card busy status on data line 0, the controller will abandon the detection. 4'b0000: No extension 4'b0001: Extend 1 more serial clock cycle 4'b0010: Extend 2 more serial clock cycles 4'b1111: Extend 15 more serial clock cycles
17	**PTCH17**	SDIO_CFG_INTC_SEL	**Selects SDIO interrupt model** 1'b0: When data line [1] = 0, trigger SDIO interrupt event. 1'b1: When data line [3:0] = 4'b1101, trigger SDIO interrupt event
16	**PTCH16**	MSDC_BLKNUM_SEL	**Supports ACMD23 reliable/force pro etc. features** 1'b0: Support ACMD23 reliable/force prog etc. feature 1'b1: Does not support ACMD23 reliable/force prog etc. feature
15	**PTCH15**	MSDC_FIFO_RD_DIS	**Disables MSDC RXFIFO read** 1'b0: Disable FIFO read permission to RXFIFO in PIO mode 1'b1: Enable FIFO read permission to RXFIFO in PIO mode
14:10	**CKGDLYS**	CKGEN_MSDC_DLY_SEL	**Selects CKBUF in CKGEN delay** Total 32 stages.
9:7	**INTCKS**	INT_DAT_LATCH_CK_SEL	**Selects internal MSDC clock phase** Total 8 stages, each stage can delay 1 clock period of msdc_src_ck.
6	**DESCUP**	DESC_UP_SEL	**SD transfer done interrupt should be issued when GPD are updated.** 1'b1: Enable new function to generate SD transfer done interrupt 1'b0: Use old function to generate SD transfer done interrupt
5	**PTCH5**	ACMD53_FAIL_ONE_SHOT	**Determines interrupt method of AUTOCMD53_FAIL** 1'b0: AUTOCMD53_FAIL interrupt will be asserted whenever CMD/DAT CRC error occurs. 1'b1: AUTOCMD53_FAIL interrupt will be asserted only when AUTOCMD53_DONE is asserted if there is CMD/DAT CRC error.
4	**PTCH4**	MASK_ACMD53_CRC_ERR_INTR	**Masks CMD/DAT CRC error interrupt when executing AUTOCMD53 training sequence** 1'b0: Enable CMD/DAT CRC error interrupt when executing AUTOCMD53 training sequence 1'b1: Mask CMD/DAT CRC error interrupt when executing AUTOCMD53 training sequence
3	**PTCH3**	RD_DAT_SEL	**Defines to use rising or falling buf data for SDR mode** 1'b0: Used rising buf data for SDR mode

MEDIATEK CONFIDENTIAL

Bit(s)	Mnemonic	Name	Description
31:29	**CRCSTSENSEL**	CRCSTS_LATCH_EN_SEL	**Configures latch CRC status enable signal for async FIFO in eMMC45** 3'b000: Latch CRC status enable signal does not delay. 3'b001: Latch CRC status enable signal delays 1T msdc_ck. 3'b010: Latch CRC status enable signal delays 2T msdc_ck. 3'b011: Latch CRC status enable signal delays 3T msdc_ck. 3'b111: Latch CRC status enable signal delays 7T msdc_ck.
28	**CFGCRCSTS**	CFG_CRCSTS	**Configures CRC status path selection** The setting only uses eMMC4.5 feature. 1'b0: Latch CRC Status select delay-line path 1'b1: Latch CRC Status select async fifo path
27:26	**CFGCRCSTSCNT**	CFG_CRCSTS_CNT	**Configures how many data are pushed in async FIFO before starting to pop out data from async FIFO** The min. register setting is 1. Do not set it to 0. The setting only uses eMMC4.5 feature. 2'b00: Push 0 data in async FIFO when starting to pop out data from async FIFO 2'b01: Push 1 data in async FIFO when starting to pop out data from async FIFO 2'b10: Push 2 data in async FIFO when starting to pop out data from async FIFO 2'b11: Push 3 data in async FIFO when starting to pop out data from async FIFO
25	**CFGCRCSTSEDGE**	CFG_CRCSTS_EDGE	**Uses rising async FIFO or falling async FIFO** 1'b0: Async FIFO latch CRC status uses rising async FIFO. 1'b1: Async fifo latch CRC status uses falling async FIFO.
24		CFG_CRCSTS_SEL	**Configures async FIFO path selection** 1'b0: Used normal path in async FIFO 1'b1: Use 2DFF path in async FIFO
23:20	**POPENCNT**	POP_EN_CNT	**Pop enable counter** Defines how many write pointer and read pointer margin begin to pop up data transfer.
18:16	**RESPSTSENSEL**	RESP_LATCH_EN_SEL	**Configures latch CMD response enable signal for async FIFO in eMMC45** 3'b000: Latch CMD response enable signal does not delay. 3'b001: Latch CMD response enable signal delays 1T msdc_ck. 3'b010: Latch CMD response enable signal delays 2T msdc_ck. 3'b011: Latch CMD response enable signal delays 3T msdc_ck. 3'b111: Latch CMD response enable signal delays 7T msdc_ck.
15	**CFGRESP**	CFG_RESP	**Configures CMD Response path selection** The setting only used eMMC4.5 feature. 1'b0: Latch CMD response selects async FIFO path. 1'b1: Latch CMD response selects delay-line path.
14:12	**CFGRESPCNT**	CFG_RESP_CNT	**Configures how many data are pushed in async FIFO before starting to pop out data from async FIFO** The min. register setting is 1. Do not set it to 0. The setting only uses eMMC4.5 feature. 3'b000: Push 0 data in async FIFO when starting to pop out data from async FIFO 3'b001: Push 1 data in async FIFO when starting to pop out data from async FIFO 3'b111: Push 7 data in async FIFO when starting to pop out data from async FIFO.
11	**INTCRESPSEL**	INTC_RESP_SEL	**Configures BREAK command async FIFO path** 1'b0: Use normal path in async FIFO 1'b1: Use 2DFF path in async FIFO
9	**CFGRDAT**	CFG_RDAT	**Configures read data path**

Name	ECOVER[15:0]															
Type	RO															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit(s)	Mnemonic	Name	Description
31:0	**ECOVER**	ECO_VER	ECO version

Module name: MSDC3 Base address: (+11260000h)

Address	Name	Width	Register Function
11260000	MSDC_CFG	32	**MSDC Configuration Register** For general configuration of the MS/SD controller
11260004	MSDC_IOCON	32	**MSDC IO Configuration Register** Contains the receiver path data latch timing control and interface control bits
11260008	MSDC_PS	32	**MSDC Pin Status Register** Stores card detection and write protection pin status. Card detection status can be disabled.
1126000C	MSDC_INT	32	**MSDC Interrupt Register** Contains the status of interrupts Note: The register still shows the status of interrupt even though the interrupt is disabled.
11260010	MSDC_INTEN	32	**MSDC Interrupt Enable Register**

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Address	Name	Width	Register Function
			Contains related enabling bit of interrupts
11260014	MSDC_FIFOCS	32	**MSDC FIFO Control and Status Register** Contains control and status of embedded 128B FIFO
11260018	MSDC_TXDATA	32	**MSDC TX Data Port Register** For PIO mode only. Used to input MSDC write data to card. The access can be AHB1B/2B/4B.
1126001C	MSDC_RXDATA	32	**MSDC RX Data Port Register** For PIO mode only. Used to read back MSDC read data from card. The access can be AHB1B/2B/4B.
11260030	SDC_CFG	32	**SD Configuration Register** Configures MS/SD memory card controller when it is configured as the host of SD memory card. If the controller is configured as the host of memory stick, the contents of the register will have no impact on the operation of the controller.
11260034	SDC_CMD	32	**SD Command Register** Defines a SD memory card command and its attributes. Before MS/SD controller issues a transaction onto SD bus, the application should specify other relative settings such as argument for command. After writing the register by the application, MS/SD controller will issue the corresponding transaction onto SD serial bus. If the command is GO_IDLE_STATE, the controller will have serial clock on SD/MMC bus running 128 cycles before issuing the command.
11260038	SDC_ARG	32	**SD Argument Register** Contains argument of SD/MMC memory card command
1126003C	SDC_STS	32	**SD Status Register** Reflects SD bus status and contains MMC stream write status
11260040	SDC_RESP0	32	**SD Response Register 0** Contains parts of the last SD/MMC memory card bus response. See description in register field SDC_RESP3.
11260044	SDC_RESP1	32	**SD Response Register 1** Contains parts of the last SD/MMC memory card bus response. See description in register field SDC_RESP3.
11260048	SDC_RESP2	32	**SD Response Register 2** Contains parts of the last SD/MMC memory card bus response. See description in register field SDC_RESP3.
1126004C	SDC_RESP3	32	**SD Response Register 3** Contains parts of the last SD/MMC memory card bus response. Register fields SDC_RESP0, SDC_RESP1, SDC_RESP2 and SDC_RESP3 are composed of the last SD/MMC memory card bus response. For response of type R2, i.e. response of the command ALL_SEND_CID, SEND_CSD and SEND_CID, only bit 127 to 0 of response token are stored in register field SDC_RESP0, SDC_RESP1, SDC_RESP2 and SDC_RESP3. SDC_RESP0 = bit 31~0 SDC_RESP1 = bit 63~32 SDC_RESP2 = bit 95~64 SDC_RESP3 = bit 127~96 For response of type R1b in auto CMD12 or R1 in auto CMD23, bit 39 to 8 of response token are stored in register field of SDC_RESP3. For the responses of other types, only bit 39 to 8 of response token are stored in the register field SDC_RESP0.
11260050	SDC_BLK_NUM	32	**SD Block Number Register** Defines block number for block transaction. For single read/write, this register should be set to 1. For multiple read/write, this register should be set to bigger than 1. Set to 0 will cause unexpected result.
11260054	SDC_VOL_CHG	32	**SD Voltage Change Wait Time Register** Defines SD voltage change check wait time.

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Address	Name	Width	Register Function
11260058	SDC_CSTS	32	**SD Card Status Register** After commands with R1 and R1b response, this register will contain the status of the SD/MMC card.
1126005C	SDC_CSTS_EN	32	**SD Card Status Enable Register** Controls which bit of SDC_CSTS will generate the MSDC_INT.SD_CSTA interrupt
11260060	SDC_DATCRC_STS	32	**SD Card Data CRC Status Register** Reflects CRC status of data line[7:0]. Only for MSDC read.
11260080	SD_ACMD_RESP	32	**SD ACMD Response Register** Stores response of auto command from SD card
11260084	SD_ACMD19_TRG	32	**SD ACMD19 Target Register** Selects target delay line to run ACMD19 sequence
11260088	SD_ACMD19_STS	32	**SD ACMD19 Status Register** Stores result of auto command 19 from SD card
1126008C	DMA_SA_HIGH4BIT	32	**DMA Current Address Register of High 4 Bits** Contains start address high 4 bits of the 36-bit address for 64G DRAM access
11260090	DMA_SA	32	**DMA Start Address Register** Contains start address of DMA descriptor
11260094	DMA_CA	32	**DMA Current Address Register** Contains current DMA address
11260098	DMA_CTRL	32	**DMA Control Register** Controls DMA operation
1126009C	DMA_CFG	32	**DMA Configuration Register** Configures DMA operation
112600A0	SW_DBG_SEL	32	**MSDC S/W Debug Selection Register** Selects SW debugging output
112600A4	SW_DBG_OUT	32	**MSDC S/W Debug Output Register** Shows selected debugging output
112600A8	DMA_LENGTH	32	**DMA Length Register** Sets up basic DMA operation length
112600B0	PATCH_BIT0	32	**MSDC Patch Bit Register 0** Configures patch function. For normal function, this bit should be kept at default value.
112600B4	PATCH_BIT1	32	**MSDC Patch Bit Register 1** Configures patch function. For normal function, this bit should be kept at default value.
112600B8	PATCH_BIT2	32	**MSDC Patch Bit Register 2** Configures patch function. For normal function, this bit should be kept at default value.
112600C0	DAT0_TUNE_CRC	32	**DAT0 Tune Result Register** Records on-line tuning result for DAT0 line
112600C4	DAT1_TUNE_CRC	32	**DAT1 Tune Result Register** Records on-line tuning result for DAT1 line
112600C8	DAT2_TUNE_CRC	32	**DAT2 Tune Result Register** Records on-line tuning result for DAT2 line
112600CC	DAT3_TUNE_CRC	32	**DAT3 Tune Result Register** Records on-line tuning result for DAT3 line
112600D0	CMD_TUNE_CRC	32	**CMD Tune Result Register** Records on-line tuning result for CMD line
112600D4	SDIO_TUNE_WIND	32	**SDIO Tune Window Register 0** Defines tuning window size for SDIO on-line CRC tuning feature

MEDIATEK CONFIDENTIAL

Address	Name	Width	Register Function
112600F0	PAD_TUNE0	32	**MSDC Pad Tuning Register 0** Configures delay line embedded in pad macro
112600F4	PAD_TUNE1	32	**MSDC Pad Tuning Register 1** Configures delay line embedded in pad macro
112600F8	DAT_RD_DLY0	32	**MSDC Data Delay Line Register 0** Configures delay line embedded in pad macro
112600FC	DAT_RD_DLY1	32	**MSDC Data Delay Line Register 1** Configures delay line embedded in pad macro
11260100	DAT_RD_DLY2	32	**MSDC Data Delay Line Register 2** Configures delay line embedded in pad macro
11260104	DAT_RD_DLY3	32	**MSDC Data Delay Line Register 3** Configures delay line embedded in pad macro
11260110	HW_DBG_SEL	32	**MSDC H/W Debug Selection Register** Selects HW debug output
11260114	MAIN_VER	32	**MSDC Main Version Register** Shows the version code of MSDC IP
11260118	ECO_VER	32	**MSDC ECO Version Register** Shows the ECO version code of MSDC IP

11260000 MSDC_CFG MSDC Configuration Register 02000099

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name							SCLK STOP SEL				CCKMD		CCKDIV[11:8]			
Type							RW				W1C		RW			
Reset							1				0	0	0	0	0	0
Bit	**15**	**14**	**13**	**12**	**11**	**10**	**9**	**8**	**7**	**6**	**5**	**4**	**3**	**2**	**1**	**0**
Name	CCKDIV[7:0]								CCKSB	BV18PSS	BV18SDT	CCKDRVE	PIO	RST	CCKPD	MSDC
Type	RW								RU	RU	RW	RW	RW	A0	RW	RW
Reset	0	0	0	0	0	0	0	0	1	0	0	1	1	0	0	1

Bit(s)	Mnemonic	Name	Description
25	SCLKSTOPSEL	SCLK_STOP_SEL	**In DDR mode, stops SCLK when device is idle whether checking SCLK phase or not** 1'b0: Stop sclk not checking SCLK phase 1'b1: Stop sclk checking SCLK phase; fix 1/4T sclk glitch in DDR mode
21:20	CCKMD	CARD_CK_MODE	**MS/SD card clock mode** 2'b00: Use clock divider output divided by msdc_src_ck as msdc_ck. bit[15]~bit[8] should be programmed. 2'b01: Use msdc_src_ck as msdc_ck. bit[15]~bit[8] is ignored. 2'b10: DDR mode; use clock divider output divided by msdc_src_ck as msdc_ck. bit[15]~bit[8] should be programmed. 2'b11: HS400 mode; use clock divider output and use msdc_src_ck as msdc_ck. bit[15]~bit[8] should be programmed.
19:8	CCKDIV	CARD_CK_DIV	**MS/SD card clock divider** Controls clock frequency of serial clock on MS/SD bus. Refer to "Data Line Latching Timing Diagram" and "Response Latching Timing Diagram". For non-DDR mode, msdc_ck equals SD bus clock. (Example: For SDR25 or HS, msdc_ck and SD bus clock will be 50MHz) For DDR mode, msdc_ck denotes MSDC internal clock which will be doubled to SD bus clock. (Example: For DDR50, msdc_ck should be set to 100MHz, and bus clock will be 50MHz.)

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Mnemonic	Name	Description
			8'b00000000: msdc_ck =(1/2)*msdc_src_ck 8'b00000001: msdc_ck = [1/(4*1)]*msdc_src_ck 8'b00000010: msdc_ck = [1/(4*2)]*msdc_src_ck 8'b00000011: msdc_ck = [1/(4*3)]*msdc_src_ck 8'b00010000: msdc_ck = [1/(4*16)]*msdc_src_ck 8'b11111111: msdc_ck = [1/(4*255)]*msdc_src_ck
7	**CCKSB**	CARD_CK_STABLE	**MS/SD card clock is stable or not** After programming CARD_CK_MODE or CARD_CK_DIV, this bit will immediately become 0 and return to 1 if stable. Poll this register to ensure safety control of MSDC. 1'b0: Clock output is not stable. 1'b1: Clock output is stable.
6	**BV18PSS**	BV_1P8_PASS	**MSDC bus voltage 1.8V detection status** SW should check this bit after BUS_VOL_18V_START_DET turns to 0 from 1. 1'b0: Error in voltage detection 1'b1: No error in voltage detection
5	**BV18SDT**	BV_1P8_START_DET	**MSDC bus voltage 1.8V detection sequence start event** SW writes 1 to this bit to trigger HW outputting 1.8V clock for 1ms and automatically detecting CMD/DAT line sequence for voltage change is passed or not. HW will clear this bit to 0 after the detection is finished. The passed or failed status is stored in bit[6] BUS_VOL_18V_PASS.
4	**CCKDRVE**	CARD_CK_DRV_EN	**SD/MS card bus clock drive enable bit** Set this bit to 1 to enable MSDC bus clock driver. The default bus state depends on MSDC_CFG][1] CARD_CK_PWDN bit. If MSDC_CFG[1] CARD_CK_PWDN=1, the default clock state will be free running. If MSDC_CFG[1] CARD_CK_PWDN=0, the default clock state will be gated to 0. Set this bit to 0 will put the bus state into "tri-state". Default: 1 1'b0: Put the clock pad into tri-state 1'b1: Enable MSDC to drive clock pad. The state of CLK depends on MSDC_CFG[1] CARD_CK_PWDN.
3	**PIO**	PIO_MODE	**MS/SD PIO mode** Selects PIO mode. Default: PIO mode
2	**RST**	RST	**Software reset** Writing 1 to this register will cause internal synchronous reset of MS/SD controller, and it will not reset register settings and DMA controller. The reset sequence is done when this bit becomes 0. SW should wait for this bit to return to 0 after writing 1. 1'b0: MS/SD controller is not in reset state. 1'b1: MS/SD controller is in reset state.
1	**CCKPD**	CARD_CK_PWDN	**MSDC bus clock power-down mode** Controls card clock power-down mode 1'b0: Clock is gated to 0 if no command or data is transmitted. 1'b1: Clock is free running even if no command or data is transmitted. (The clock may still be stopped when MSDC write data are not enough or no space for the next read data.)
0	**MSDC**	MSDC	**Selects MS/SD mode** Configures the controller to be the host of memory stick or host of SD/MMC memory card. The default value is configuring the controller as the host of memory stick. 1'b0: Configure controller to be host of memory stick 1'b1: Configure controller to be host of SD/MMC memory card

Bit(s)	Mnemonic	Name	Description
0	**SDR104CKS**	SDR104_CLK_SEL	**SDR104 SCLK output clock control** Only used when MSDC_CFG[17:16] CARD_CK_MODE is 2'b01. 1'b0: Bus clock output equals inverted msdc_src_ck 1'b1: Bus clock output equals msdc_src_ck

11260008 MSDC_PS MSDC Pin Status Register 01FF0002

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	SDWP							CMD	DAT							
Type	RU							RU	RU							
Reset	0							1	1	1	1	1	1	1	1	1
Bit	**15**	**14**	**13**	**12**	**11**	**10**	**9**	**8**	**7**	**6**	**5**	**4**	**3**	**2**	**1**	**0**
Name	CDDBCE														CDSTS	CDEN
Type	RW														RU	RW
Reset	0	0	0	0											1	0

Bit(s)	Mnemonic	Name	Description
31	**SDWP**	SD_WP	**Write Protection switch status on SD memory card** Shows the status of Write Protection switch on SD memory card. There is no default reset value. The pin WP (Write Protection) is only useful when the controller is configured for SD memory card. 1'b0: Write Protection switch on, i.e. memory card will be write-protected. 1'b1: Write Protection switch off, i.e. memory card is writable.
24	**CMD**	CMD	**Command line status** Reflects the command line value of MSDC bus.
23:16	**DAT**	DAT	**Data line status** Reflects the data line value of MSDC bus (8-bit).
15:12	**CDDBCE**	CDDEBOUNCE	**Card detection de-bounce timer** Specifies the time interval for card detection de-bounce. Default value: 0, meaning the de-bounce interval is one 32kHz cycle. The interval will extend one cycle time of 32kHz by increasing the counter by 1.
1	**CDSTS**	CDSTS	**Card detection status** 1'b0: Card detection pin status is logic low. 1'b1: Card detection pin status is logic high.
0	**CDEN**	CDEN	**Enables card detection** Controls the card detection circuit. 1'b0: Disable card detection 1'b1: Enable card detection

1126000C MSDC_INT MSDC Interrupt Register 00000000

	RCERR	O	XFDNE	CPL	TS	RCER	O	DY	IRQ	QEPTY	DRCRCER	DCTO	DCRDY		CCDSC	IRQ
Type	W1C	W1C	W1C	W1C	RU	W1C	W1C	W1C	W1C	W1C	W1C	W1C	W1C		W1C	W1C
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0		0	0

Bit(s)	Mnemonic	Name	Description
22	**AC53FAIL**	AUTOCMD53_FAIL	**SD auto command 53 status register** When auto-command 53 tuning sequence fails , this register will be set to 1 by HW.
21	**AC53DONE**	AUTOCMD53_DONE	**SD auto command 53 status register** When auto-command 53 tuning sequence is finished, this register will be set to 1 by HW.
20	**GEAROUTBOUND**	GEAR_OUT_BOUND	**The gear setting of delay line is out of boundary in the process of SDIO Autocmd 53 On-Line tuning**
19	**DMAPROTECT**	DMA_PROTECT	**There is write operation to DMA start address, length, start bit or the last BUF bit.**
18	**GPDCSERR**	GPD_CS_ERR	**GPD checksum error detected**
17	**BDCSERR**	BD_CS_ERR	**BD checksum error detected**
16	**AC19DONE**	AUTOCMD19_DONE	**SD auto command 19 status register** When auto-command 19 is enabled, HW will clear this register to 0. As the tuning sequence is finished (32 times), this register will be set to 1 by HW. SW should check AUTOCMD_STS0 and SUTOCMD_STS1 only when this bit is on.
15	**SDDCRCERR**	SD_DATA_CRCERR	1'b0: Otherwise 1'b1: MS/SD controller detects a CRC error after reading a block of data from the DAT line or SD/MMC signals a CRC error after writing a block of data to the DAT line.
14	**SDDTO**	SD_DATTO	
13	**DMAXFDNE**	DMA_XFER_DONE	**DMA transfer done interrupt** Indicates status of data block transfer. 1'b0: Otherwise 1'b1: A data block is successfully transferred.
12	**SDXFCPL**	SD_XFER_COMPLETE	**SD data transfer completed interrupt** Indicates transaction which contains data that are completed. While performing tuning procedure (Execute Tuning is set to 1), SD_XFER_COMPLETE is not set to 1.
11	**SDCSTS**	SD_CSTS	**SD CSTA update interrupt** Indicates any bit in register SDC_CSTA is active. The register bit will be set to 1. SW should clear SDC_CSTA, and this bit will be de-asserted automatically.
10	**SDRCRCER**	SD_RESP_CRCER	**SD command CRC error interrupt** Indicates SD/MMC controller detects a CRC error after reading a response from the CMD line. 1'b0: Otherwise 1'b1: SD/MMC controller detects a CRC error after reading a response from the CMD line.
9	**SDCTO**	SD_CMDTO	**SD command time-out interrupt** Indicates SD/MMC controller detects a time-out condition while waiting for a response on the CMD line. 1'b0: Otherwise 1'b1: SD/MMC controller detects a time-out condition while waiting for a response on the CMD line.
8	**SDCRDY**	SD_CMDRDY	**SD command ready interrupt** For the command without response, the register bit will be 1 once the

MEDIATEK CONFIDENTIAL

Bit(s)	Mnemonic	Name	Description
			command is completed on SD/MMC bus. For command with response without busy, the register bit will be 1 whenever the command is issued onto SD/MMC bus and its corresponding response is received without CRC error. For command with response with busy in DAT0, the register bit will be 1 whenever the command is issued onto SD/MMC bus and its corresponding response is received without CRC error and the DAT0 transited from busy to idle. 1'b0: Otherwise 1'b1: Command finished successfully without CRC error.
7	**SDIOIRQ**	SD_SDIOIRQ	**SD SDIO interrupt** Indicates the interrupt is sensed in the SDIO bus. 1'b0: No interrupt on SDIO bus 1'b1: Interrupt on SDIO bus
6	**DMAQEPTY**	DMA_Q_EMPTY	**DMA queue empty interrupt** Indicates the current DMA queue is empty. Only for descriptor mode and enhance mode.
5	**SDACDRCRCER**	SD_AUTOCMD_RESP_CRCERR	**SD auto command CRC error interrupt** Set when detecting a CRC error in the auto command response.
4	**SDACDCTO**	SD_AUTOCMD_CMDTO	**SD auto command time-out interrupt** Set if no response is returned within a specified cycles (64T in spec) from the end bit of auto command.
3	**SDACDCRDY**	SD_AUTOCMD_CMDRDY	**SD auto command ready interrupt** Set if auto command is executed without CRC error or timeout.
1	**MSDCCDSC**	MSDC_CDSC	**MSDC card detection status change interrupt** Indicates if any interrupt for memory card insertion/removal exists. Whenever memory card is inserted or removed and card detection circuit is enabled, i.e. register bit CDEN in register MSDC_PS is set to 1, the register bit will be set to 1. It will be reset when the register is read. 1'b0: Otherwise 1'b1: Card is inserted or removed.
0	**MMCIRQ**	MMC_IRQ	**MMC card interrupt** 1'b0: Otherwise 1'b1: MMC card interrupt event occurs.

Bit(s)	Mnemonic	Name	Description
			8'b11111111: Extend 1,048,576*256 more serial clock cycles
21	**INTBGP**	INT_AT_BLOCK_GAP	**Interrupt at block gap** This bit is valid only in 4-bit mode of the SDIO card and selects a sample point in the interrupt cycle. Set to 1 will enable interrupt detection at the block gap for a multiple block transfer. Set to 0 will disable interrupt detection during a multiple block transfer. If the SD card cannot signal an interrupt during a multiple block transfer, this bit should be set to 0. When the host driver detects an SD card insertion, it will set up this bit according to CCCR of the SDIO card. 1'b0: Disable interrupt detection at block gap 1'b1: Enable interrupt detection at block gap
20	**SDIOIDE**	SDIO_INT_DET_EN	**Enables SDIO interrupt detection** Informs SD controller to sense SDIO interrupt. 1'b0: Disable SDIO interrupt detection 1'b1: Enable SDIO interrupt detection if SDIO bit is also on
19	**SDIO**	SDIO	**SDIO mode enable bit** Enables support to sense SDIO interrupt and disables R4 response CRC check for SDIO card. 1'b0: Disable SDIO mode 1'b1: Enable SDIO mode
17:16	**BUSWD**	BUSWIDTH	**Configures bus width** Defines SD/MMC bus width. 2'b00: 1-bit mode 2'b01: 4-bit mode 2'b10: 8-bit mode 2'b11: Reserved
1	**ENWKUPINS**	WAKEUP_INS_EN	**Card status change wakeup event enable bit** 1'b0: Disable wakeup event for card status change 1'b1: Enable wakeup event for card status change
0	**ENWKUPSDIOINT**	WAKEUP_SDIOINT_EN	**SDIO card interrupt wakeup event enable bit** 1'b0: Disable wakeup event for SDIO card interrupt 1'b1: Enable wakeup event for SDIO card interrupt

11260034 **SDC_CMD** **SD Command Register** **00000000**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	**ACMD53**	**VOLSWTH**	**ACMD**		**LEN**											
Type	RW	RW	RW		RW											
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Type	RW	RW	RW	RW			RW			RW	RW					
Reset	0	0	0	0	0		0	0	0	0	0	0	0	0	0	0

Bit(s)	Mnemonic	Name	Description
31	**ACMD53**	AUTO_CMD53	**Enables auto command 53** Should be used exclusively with AUTO_CMD, meaning AUTO_CMD != 2'b00. This field should be assigned to 1'b0. If this filed is assigned to 1'b1, AUTO_CMD should be set to 2'b00. 1'b0: Disable Auto Command 53 1'b1: Enable Auto Command 53
30	**VOLSWTH**	VOL_SWTH	**Voltage switch command** 1'b0: Disable voltage switch detection

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Mnemonic	Name	Description
			1'b1: Enable voltage switch detection
29:28	**ACMD**	AUTO_CMD	**Enables auto command** Determines use of auto command functions. This function can be used in all modes including PIO/Basic DMA/Descriptor DMA/Enhanced Mode. There are two methods to stop multiple-block read and write operation. 1. Enabling auto CMD12 Multiple-block read and write commands for memory require CMD12 to stop the operation. When ACMD-12 is used, MSDC issues CMD12 automatically when the last block transfer is completed. Auto CMD12 error is indicated to the MSDC_INT register. The host driver shall not set up this bit if the command does not require CMD12. In particular, secure commands defined in the Part 3 File Security specification do not require CMD12. 2. Enabling auto CMD23 When ACMD-23 is used, MSDC issues a CMD23 automatically before issuing a command specified in the CMD field. The Host Controller Version 3.00 and later versions support this function. By writing the command register, MSDC issues a CMD23 first then a command specified by the CMD field in the SDC_CMD register. If response errors of CMD23 are detected, the second command will not be issued. A CMD23 error is indicated in the MSDC_INT register. 32-bit block count value for CMD23 is set to the SDC_BLOCK_NUM register. 2'b00: Disable Auto Command 2'b01: Enable Auto CMD12 2'b10: Enable Auto CMD23 2'b11: Enable Re-tuning CMD19
27:16	**LEN**	LEN	**Length** Defines the length of one block (unit: byte) in a data transaction of block mode or the data length (unit: byte) in data transaction of byte mode. The maximum value of block length is 2,048 bytes. 12'b000000000000: Reserved 12'b000000000001: Block length is 1 byte 12'b000000000010: Block length is 2 byte 12'b011111111111: Block length is 2047 byte 12'b100000000000: Block length is 2048 byte
15	**GOIRQ**	GO_IRQ	**GO_IRQ command** Indicates if the command is GO_IRQ_STATE (CMD40) and used only for MMC protocol. If the command is GO_IRQ_STATE, the period between command token and response token will not be limited. 1'b0: The command is not GO_IRQ_STATE 1'b1: The command is GO_IRQ_STATE
14	**STOP**	STOP	**Stop command** Indicates if the command is a stop transmission command. It should be set to 1 when CMD12 (SD/MMC) or CMD52 with I/O abort (SDIO) is to be issued. 1'b0: The command is not a stop transmission command 1'b1: The command is a stop transmission command
13	**RW**	RW	**Selects command read write** The register bit defines the command is a read command or write command. The register bit is valid only when the command causes a transaction with data token. 1'b0: The command is a read command 1'b1: The command is a write command
12:11	**DTYPE**	DTYPE	**Selects data block** Defines data token type for the command. 2'b00: No data token for the command

MEDIATEK CONFIDENTIAL

Type		RW			RW	RW	RW	RW					RU	WO	A0	WO
Reset		1	1	0	0	0	0	0					1	0	0	0

Bit(s)	Mnemonic	Name	Description
14:12	BSTSZ	BURST_SIZE	**DMA burst size** Specifies the maximum transfer bytes allowed at the device per DMA burst. This field cannot be modified when the DMA status is 1. 3'd3: 8 Bytes 3'd4: 16 Bytes 3'd5: 32 Bytes 3'd6: 64 Bytes Other: Reserved

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Mnemonic	Name	Description
11	**SPLIT1K**	DMA_SPLIT_1K	**Specifies split burst when corssing 1K boundary address** 1'b0: 1K boundary not split 1'b1: 1K boundary split
10	**LASTBF**	LAST_BUF	**Last buffer of the basic DMA mode** Indicates the last buffer in basic DMA mode.
9	**DMAALIGN**	DMA_ALIGN	**Specifies address alignment burst size** 1'b0: do not DAM burst size alignment 1'b1: DAM burst size alignment
8	**DMAMOD**	DMA_MODE	**DMA operation mode** Indicates operation mode of DMA. 1'b0: Basic DMA mode 1'b1: Descriptor base DMA mode
3	**READYM**	AHB_READYM	**Only for debugging when DMA hangs** SW checks if AHB bus is ok when GDMA hangs. 1: bus is normal 0: bus not normal
2	**DMARSM**	DMA_RESUME	**DMA resume control register** Resumes DMA transaction. Read always returns to 0.
1	**DMASTOP**	DMA_STOP	**DMA stop control register** Stops DMA transaction. When SW issues STOP command, SW must wait for this bit to be de-asserted or DMA inactive to guarantee stop is done.
0	**DMASTART**	DMA_START	**DMA start control register** Starts DMA transaction. Read always returns to 0.

1126009C **DMA_CFG** **DMA Configuration Register** **00000004**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit(s)	Mnemonic	Name	Description
31	**PTCH31**	EN_MMC_DRV_RESP	**Enables MSDC always driving bus when outputting wake-up response (BREAK)** 1'b0: Disable 1'b1: Enable
30	**PTCH30**	DETECT_WR_CRC_TIMEOUT	**Detects MSDC write data CRC phase time-out** 1'b0: Does not detect CRC phase timeout 1'b1: Detect CRC phase timeout
29	**PTCH29**	SPC_ALWAYS_PUSH	**SPC buffer push mechanism** 1'b0: Push the buffer only when read transfer is on-going 1'b1: Always push the buffer
28	**PTCH28**	SDIO_INT_DLY_SEL	**Selects SDIO interrupt latch time** 1'b0: Latch the data line value in internal SDIO interrupt period 1'b1: Latch the data line value in 1 clock delay of internal SDIO interrupt period
27	**PTCH27**	SDC_CMD_CMDFAIL_SEL	**Selects SDIO interrupt period recovery** 1'b0: SDIO interrupt period will re-start after a CMD12 or CMD52 command is issued 1'b1: SDIO interrupt period whenever DAT line is not busy

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL

Bit(s)	Mnemonic	Name	Description
26	**PTCH26**	SDC_CMD_IDRT_SEL	**Selects SD identification response time** The register bit indicates if the command has a response with NID (i.e. 5 serial clock cycles as defined in SD memory card Specification Part 1 Physical Layer Specification version 1.0) response time. The register bit is valid only when the command has a response token. Thus, the register bit must be set to 1 for CMD2 (ALL_SEND_CID) and ACMD41 (SD_APP_OP_CMD). 1'b0: Otherwise. 1'b1: The command has a response with NID response time.
25:22	**PTCH22**	SDC_CFG_WDOD	**SD Write Data Output Delay** The period from finish of the response for the initial host write command or the last write data block in a multiple block write operation to the start bit of the next write data block requires at least two serial clock cycles. The register field is used to extend the period (Write Data Output Delay) in unit of one serial clock. 4'b0000: No extension 4'b0001: Extend 1 more serial clock cycle 4'b0010: Extend 2 more serial clock cycles 4'b1111: Extend 15 more serial clock cycles
21:18	**PTCH18**	SDC_CFG_BSYDLY	**SD R1B busy detection mode** Only valid for the commands with R1b response. If the command has a response of R1b type, MS/SD controller must monitor the data line 0 for card busy status from the bit time that is two serial clock cycles after the command end bit to check if operations in SD/MMC memory card are finished. The register field is used to expand the time between the command end bit and end of detection period to detect card busy status. If time is up and there is no card busy status on data line 0, the controller will abandon the detection. 4'b0000: No extension 4'b0001: Extend 1 more serial clock cycle 4'b0010: Extend 2 more serial clock cycles 4'b1111: Extend 15 more serial clock cycles
17	**PTCH17**	SDIO_CFG_INTC_SEL	**Selects SDIO interrupt model** 1'b0: When data line [1] = 0, trigger SDIO interrupt event. 1'b1: When data line [3:0] = 4'b1101, trigger SDIO interrupt event
16	**PTCH16**	MSDC_BLKNUM_SEL	**Supports ACMD23 reliable/force pro etc. features** 1'b0: Support ACMD23 reliable/force prog etc. feature 1'b1: Does not support ACMD23 reliable/force prog etc. feature
15	**PTCH15**	MSDC_FIFO_RD_DIS	**Disables MSDC RXFIFO read** 1'b0: Disable FIFO read permission to RXFIFO in PIO mode 1'b1: Enable FIFO read permission to RXFIFO in PIO mode
14:10	**CKGDLYS**	CKGEN_MSDC_DLY_SEL	**Selects CKBUF in CKGEN delay** Total 32 stages.
9:7	**INTCKS**	INT_DAT_LATCH_CK_SEL	**Selects internal MSDC clock phase** Total 8 stages, each stage can delay 1 clock period of msdc_src_ck.
6	**DESCUP**	DESC_UP_SEL	**SD transfer done interrupt should be issued when GPD are updated.** 1'b1: Enable new function to generate SD transfer done interrupt 1'b0: Use old function to generate SD transfer done interrupt
5	**PTCH5**	ACMD53_FAIL_ONE_SHOT	**Determines interrupt method of AUTOCMD53_FAIL** 1'b0: AUTOCMD53_FAIL interrupt will be asserted whenever CMD/DAT CRC error occurs. 1'b1: AUTOCMD53_FAIL interrupt will be asserted only when AUTOCMD53_DONE is asserted if there is CMD/DAT CRC error.
4	**PTCH4**	MASK_ACMD53_CRC_ERR_INTR	**Masks CMD/DAT CRC error interrupt when executing AUTOCMD53 training sequence** 1'b0: Enable CMD/DAT CRC error interrupt when executing

5.9 AUXADC

5.9.1 Introduction

The auxiliary ADC unit is used to identify the plugged peripheral and perform temperature measurement. There are 16 input channels allowing diverse applications, such as temperature measurement and light sensor.

Each channel only operates in the immediate mode. The time-trigger mode is removed now.
In the immediate mode, the A/D converter samples the value once only when the flag in the AUXADC_CON1 register is set. For example, if the flag IMM0 in AUXADC_CON1 is set, the A/D converter will sample the data for channel 0. The IMM flags have to be cleared and set again to initialize another sampling. The value sampled for channel 0 is stored in register AUXADC_DAT0, and the value for channel 1 is stored in register AUXADC_DAT1 and so on. If the AUTOSET(x) flag in the register AUXADC_CON0 is set, the auto-sampling function will be enabled in channel(x). The A/D converter samples the data for the channel(x) in which the corresponding data register is read. For example, in the case the AUTOSET0 flag is set. When the data register AUXADC_DAT0 is read, the A/D converter will sample the next value for channel 0 immediately.

If multiple channels are selected at the same time, the task will be performed sequentially on every selected channel from high to low channel. For example, if AUXADC_CON1 is set to 0x7f, i.e. all 7 channels are selected, the state machine in the unit will start sampling from channel 6 to channel 0 and saves the values of each input channel in respective registers. The same process also applies to the timer-triggered mode.

The PUWAIT_EN bit in register AUXADC_CON3 is used to power up the analog port in advance, ensuring that the power is ramped up to the stable state before A/D converter starts the conversion. The analog part is automatically powered down after the conversion is completed.

Besides, there are several embedded temperature sensors. The module accepts signals from module of thermal controller to measure the temperature of the embedded sensors. The measurement result is able to be read in the command registers in the module of thermal controller.

5.9.2 Features

Table 5-4 describes the features in the AUXADC module.

Table 5-4. AUXADC: feature list

Item	Main function	Description
1	Immediate analog-digital conversion	In immediate mode, it supports auto-set option. In time-trigger mode, it supports auto-clear option.
2	Background detection and interrupt	The related command registers: AUXADC_DET_VOLT, AUXADC_PERIOD, AUXADC_DEBT, AUXADC_SEL
3	Temperature measurement

5.9.3 Block Diagram

SW controls the AUXADC through the APB bus. Once the hardware receives the command, it will trigger AUXADC channel sampling automatically. SW polls the status register or waits for interrupts from the CPU.

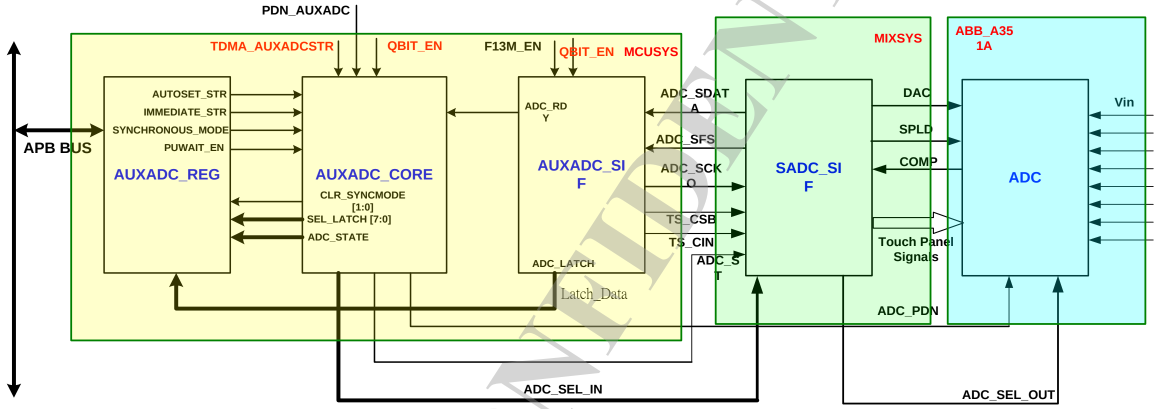

Figure 5-18. Block diagram of AUXADC

5.9.4 Theory of Operation

5.9.4.1 SAR ADC

Successive-approximation-register (SAR) ADC provides low power consumption, cost-effective and medium resolution. The AUXADC is SAR ADC architecture.

Here is an 8-bit conversion example. V_{REF} is the reference voltage of AUXADC.

The AUXADC implements a binary search algorithm. An initial register V_{DA} value compared to the input voltage V_{IN} is the mid-value between (2^8-1) and 0. The value represents V_{REF} /2. If V_{IN} is bigger than V_{DA}, the output of comparison will be 1, and the MSB-bit will be 1. On the contrary, the MSB bit will be 0. Subsequently, bit 7 will be set to 1, and another comparison is done. Bit 6 to bit 0 will be executed as the previous action. Then, the 8-bit digital value will be available.

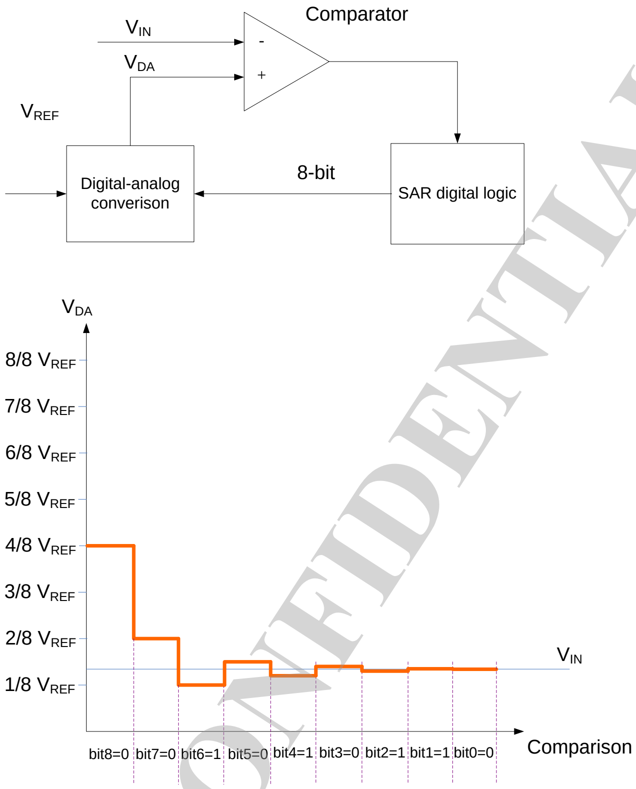

Figure 5-19. SAR ADC architecture and conversion

5.9.4.2 Design Partition

Table 5-5 shows the design partition.

Table 5-5. AUXADC: design partition

Sub module name (hier1)	Description
AUXADC	Top module
AUXADC_REG	APB command registers
AUXADC_SIF	ADC serial interface with the module SADC_SIF
AUXADC_DEBUG	Debugging signal selection
AUXADC_MONITOR	Background detection and generate interrupt
AUXADC_CORE	AUXADC state machine and handle sampling sequence
SADC_SIF	Generate signals to analog part and transfer ADC result to the module AUXADC

5.9.5 Register Definition

Module name: AUXADC Base address: (+11001000h)

Address	Name	Width	Register Function
11001000	AUXADC_CON0	32	**AUXADC Control Register 0** Defines auto-sample mode of the module

MEDIATEK CONFIDENTIAL

5.10 I2C/SCCB Controller

5.10.1 Introduction

I2C (Inter-IC)/SCCB (Serial Camera Control Bus) is a two-wire serial interface. The two signals are SCL and SDA. SCL is a clock signal that is driven by the master. SDA is a bi-directional data signal that can be driven by either the master or the slave. This generic controller supports the master role and conforms to the I2C specification.

5.10.2 Features

- I2C compliant master mode operation
- Adjustable clock speed for LS/FS mode operation
- Supports 7-bit/10-bit addressing
- Supports high-speed mode
- Supports slave clock extension
- START/STOP/REPEATED START condition
- Manual transfer mode
- Multi-write per transfer
- Multi-read per transfer
- Multi-transfer per transaction
- Combined format transfer with length change capability.
- Active drive/wired-and I/O configuration
- Repeated start multiple transfer

5.10.2.1 Manual Transfer Mode

The controller offers manual mode.

When the manual mode is selected, in addition to the slave address register, the controller has a built-in 8-byte deep FIFO which allows MCU to prepare up to 8 bytes of data for a write transfer, or read up to 8 bytes of data for a read transfer.

5.10.2.2 Transfer Format Support

This controller is designed to be as generic as possible in order to support a wide range of devices that may utilize different combinations of transfer formats. Here are the transfer format types supported through different software configurations:

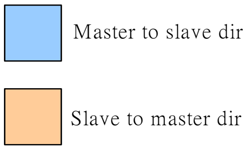
Wording convention note

- Transfer = Anything encapsulated within a Start and Stop or Repeated Start.
- Transfer length = Number of bytes within the transfer
- Transaction = This is the top unit. Everything combined equals 1 transaction.

MEDIATEK CONFIDENTIAL

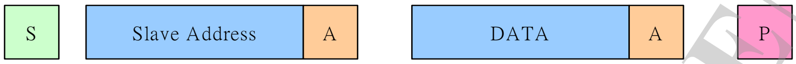
This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

- Transaction length = Number of transfers to be conducted.

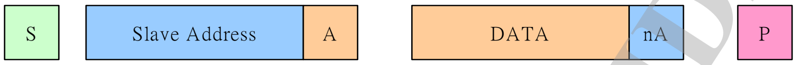


Single byte access

Single Byte Write

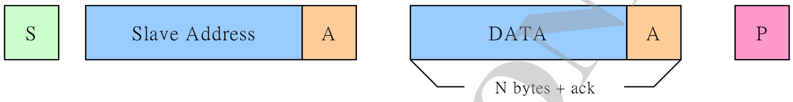


Single Byte Read

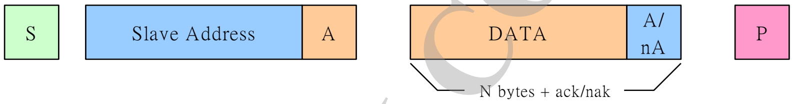


Multi byte access

Multi Byte Write

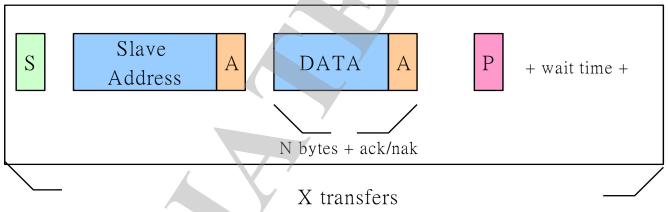


Multi Byte Read

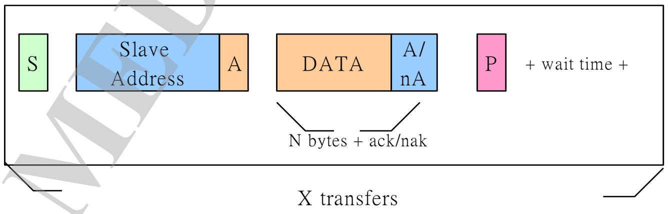


Multi-byte transfer + multi-transfer (same direction)

Multi Byte Write + Multi Transfer



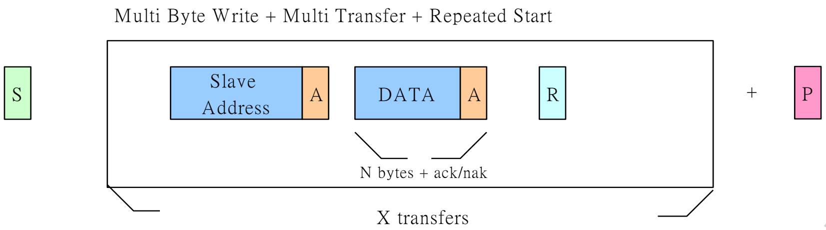
Multi Byte Read + Multi Transfer

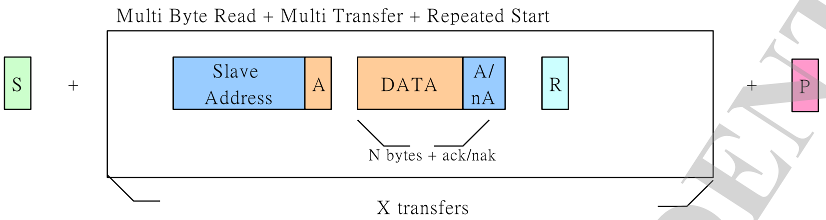


Multi-byte transfer + multi-transfer w RS (same direction)

MEDIATEK CONFIDENTIAL

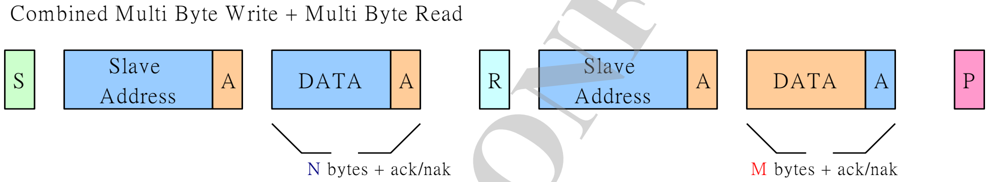
This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.



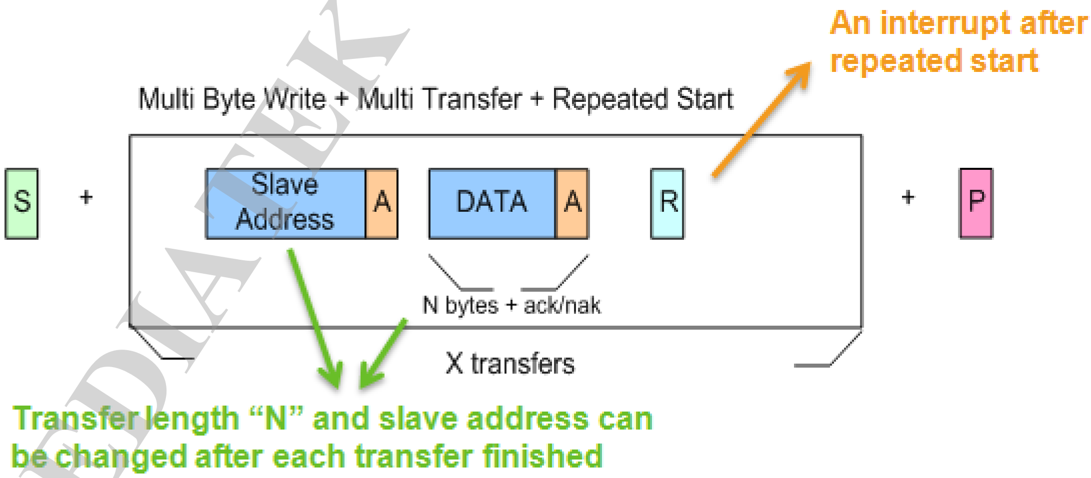


Combined write/read with Repeated Start (direction change)

Note: Only supports write and then read sequence. Read and then write is not supported.

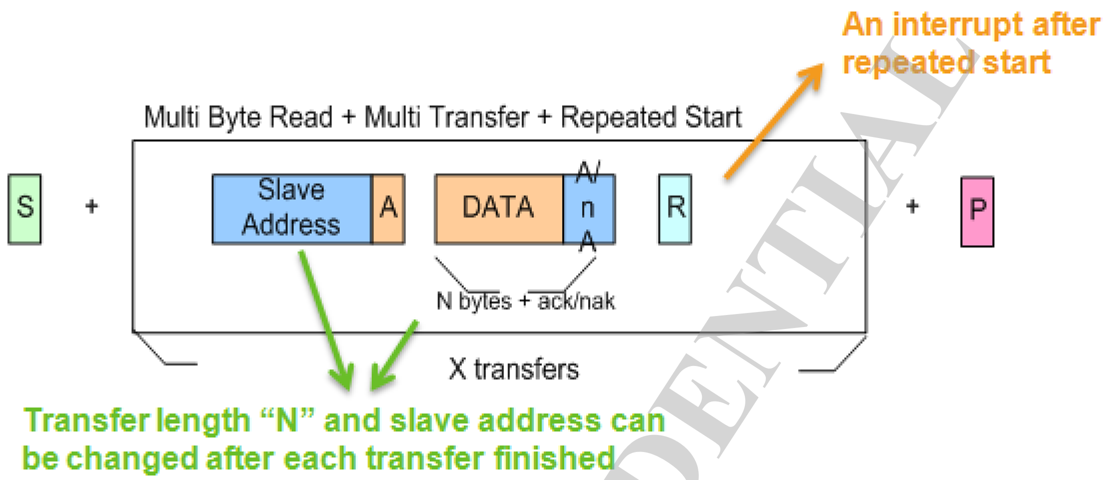


Repeated start multiple transfer (write/read)



MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.



5.10.3 Block Diagram

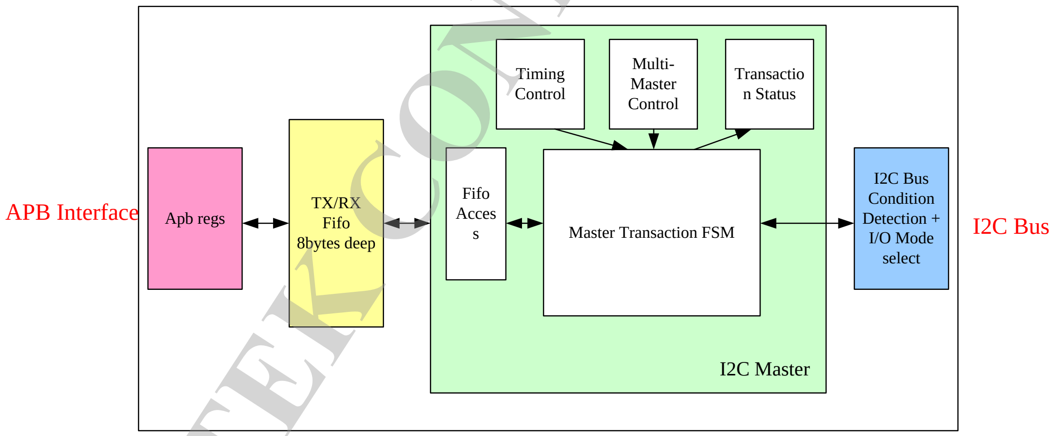


Figure 5-20. Block diagram of I2C

5.10.4 Register Definition

I2C number	Base address	Feature
I2C0	0x11007000	Supports DMA
I2C1	0x11008000	Supports DMA
I2C2	0x11009000	Supports DMA
I2C3	0x1100F000	Supports DMA

There are four I2C IPs in this SOC. The usage of the registers below is the same except that the base address must be changed to respective one.

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL

Module name: i2c0 Base address: (+11007000h)

Address	Name	Width	Register Function
11007000	DATA_PORT	16	Data Port Register
11007004	SLAVE_ADDR	16	Slave Address Register
11007008	INTR_MASK	16	Interrupt Mask Register
1100700C	INTR_STAT	16	Interrupt Status Register
11007010	CONTROL	16	Control Register
11007018	TRANSAC_LEN	16	Transaction Length Register (Number of Transfers per Transaction)
1100701C	DELAY_LEN	16	Inter Delay Length Register
11007020	TIMING	16	**Timing Control Register** LS/FS only. This register is used to control the output waveform timing. Each half pulse width, i.e. each high or low pulse, is equal to (step_cnt_div+1)*(sample_cnt_div +1)/13MHz
11007024	START	16	Start Register
11007028	EXT_CONF	16	Extension Configuration Register
11007030	FIFO_STAT	16	FIFO Status Register
11007034	FIFO_THRESH	16	**FIFO Thresh Register** For debugging only. By default these values do not need to be adjusted. Note that for Rx, no time-out mechanism is implemented. Therefore, RX_trig_thresh must be left at 0, or there will be data left in FIFO that is not fetched by DMA controller.
11007038	FIFO_ADDR_CLR	16	FIFO Address Clear Register
11007040	IO_CONFIG	16	**IO Config Register** Configures I/O for the SDA and SCL lines to select between normal I/O mode or open-drain mode to support wired-and bus.
11007044	DEBUG	16	**Reserved Debug Register** *Note: This register is for debugging only. The bits are R/W. Do not change the default values.*
11007048	HS	16	**High Speed Mode Register** Contains options for supporting high-speed operation features. Each HS half pulse width, i.e. each high or low pulse, is equal to (step_cnt_div+1)*(sample_cnt_div+1)/13MHz
11007050	SOFTRESET	16	Soft Reset Register
11007054	I2C0_I2CREG_HW_CG_EN	16	HW DCM Enable
11007064	DEBUGSTAT	16	Debug Status Register
11007068	DEBUGCTRL	16	Debug Control Register
1100706C	TRANSFER_LEN_AUX	16	Transfer Length Register (Number of Bytes per Transfer)

11007000 DATA_PORT Data Port Register 0000

Bit(s)	Mnemonic	Name	Description
4		RS_MULTIPLE	
3	**ARB_LOST**	ARB_LOST	**This status is asserted if the I2C controller loses arbitration.**
2	**HS_NACKERR**	HS_NACKERR	**This status is asserted if HS master code NACK error detection is enabled.** If enabled, HS master code NACK ERR will cause transaction to end and stop will be issued.
1	**ACKERR**	ACKERR	**This status is asserted if ACK error detection is enabled.** If enabled, ACKERR will cause transaction to end and stop will be issued.
0	**TRANSAC_COMP**	TRANSAC_COMP	**This status is asserted when an transaction has completed successfully.**

11007010 CONTROL Control Register 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name										**TRANSFER_LEN_CHANGE**	**ACKERR_DET_EN**	**DIR_CHANGE**	**CLK_EXT_EN**	**DMA_EN**	**RS_STOP**	
Type										RW	RW	RW	RW	RW	RW	
Reset										0	0	0	0	0	0	

Bit(s)	Mnemonic	Name	Description
6	**TRANSFER_LEN_CHANGE**	TRANSFER_LEN_CHANGE	**Specifies whether or not to change the transfer length after the first transfer is completed** If enabled, the transfers after the first transfer will use the transfer_len_aux parameter.
5	**ACKERR_DET_EN**	ACKERR_DET_EN	**Enables slave ack error detection.** When enabled, if slave ack error is detected, the master shall terminate the transaction by issuing a STOP condition and then asserts ackerr interrupt. MCU shall handle this case appropriately and then resets the FIFO address before reissuing transaction again. If this option is disabled, the controller will ignore slave ack error and keep on scheduled transaction. 0: Disable 1: Enable
4	**DIR_CHANGE**	DIR_CHANGE	**For combined transfer format** The direction of transfer is to be changed from write to read after the first RS condition *Note: When set to 1, the transfers after the direction change will base on the transfer_len_aux parameter.* 0: Disable 1: Enable
3	**CLK_EXT_EN**	CLK_EXT_EN	**I2C spec allows slaves to hold the SCL line low if it is not yet ready for further processing** Therefore, if this bit is set to 1, the master controller will enter a high wait state until the slave releases the SCL line.
2	**DMA_EN**	DMA_EN	**By default, this is disabled, and FIFO data shall be manually prepared by MCU.** This default setting should be used for transfer sizes of less than 8 data bytes and no multiple transfer is configured. When enabled, DMA requests are turned on, and the FIFO data should be prepared in memory.

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Mnemonic	Name	Description
1	**RS_STOP**	RS_STOP	**In LS/FS mode, this bit affects multi-transfer transaction only.** It controls whether or not REPEATED-START condition is used between transfers. The last ending transfer always ends with a STOP. In HS mode, this bit must be set to 1. 0: Use STOP 1: Use REPEATED-START

11007018 TRANSAC_LEN Transaction Length Register (Number of Transfers per Transaction) 0001

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									TRANSFER_LEN							
Type									RW							
Reset									0	0	0	0	0	0	0	1

Bit(s)	Mnemonic	Name	Description
7:0	**TRANSFER_LEN**	TRANSFER_LEN	**Indicates the number of transfers to be transferred in 1 transaction unit** *Note: The value must be set to be bigger than 1; otherwise no transfer will take place.*

1100701C DELAY_LEN Inter Delay Length Register 0002

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									DELAY_LEN							
Type									RW							
Reset									0	0	0	0	0	0	1	0

Bit(s)	Mnemonic	Name	Description
7:0	**DELAY_LEN**	DELAY_LEN	**Sets up wait delay between consecutive transfers when the RS_STOP bit is set to 0** The unit is the same as half pulse width.

11007020 TIMING Timing Control Register 1303

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	DATA_READ_ADJ	DATA_READ_TIME				SAMPLE_CNT_DIV					STEP_CNT_DIV					
Type	RW	RW				RW					RW					
Reset	0	0	0	1		0	1	1			0	0	0	0	1	1

Overview LS/FS only. This register is used to control the output waveform timing. Each half pulse width, i.e. each high or low pulse, is equal to (step_cnt_div+1)*(sample_cnt_div +1)/13MHz

Bit(s)	Mnemonic	Name	Description
15	**DATA_READ_ADJ**	DATA_READ_ADJ	**When set to 1, data latch in sampling time during master reads are adjusted according to DATA_READ_TIME value.** Otherwise, by default data are latched in at half of the high pulse

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Mnemonic	Name	Description
			width point. This value must be set to smaller than or equal to half the high pulse width.
14:12	**DATA_READ_TIME**	DATA_READ_TIME	**Valid only when DATA_READ_ADJ is set to 1** This can be used to adjust so that data are latched in at earlier sampling points (assume data are settled by then).
10:8	**SAMPLE_CNT_DIV**	SAMPLE_CNT_DIV	**Used for LS/FS only** Adjusts the width of each sample. Sample width = sample_cnt_div*1/13MHz
5:0	**STEP_CNT_DIV**	STEP_CNT_DIV	**Specifies the number of samples per half pulse width, i.e. each high or low pulse**

11007024 START Start Register 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	RS_STOP_MULTIPLE_CONFIG	RS_STOP_MULTIPLE_TRIG	RS_STOP_MULTIPLE_TRIG_CLR													START
Type	RW	RW	RO													RW
Reset	0	0	0													0

Bit(s)	Mnemonic	Name	Description
15	**RS_STOP_MULTIPLE_CONFIG**	RS_STOP_MULTIPLE_CONFIG	**Enables multiple r/w & length & slave address with rs_stop transfer**
14	**RS_STOP_MULTIPLE_TRIG**	RS_STOP_MULTIPLE_TRIG	**Triggers the next transfer when enabling multiple r/w & length & slave address with rs_stop transfer**
13	**RS_STOP_MULTIPLE_TRIG_CLR**	RS_STOP_MULTIPLE_TRIG_CLR	**Clears rs_stop_mul_trig for the next transfer**
0	**START**	START	**Starts transaction on bus** It is auto de-asserted at the end of transaction.

11007028 EXT_CONF Extension Configuration Register 1800

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	EXT_TIME															EXT_EN
Type	RW															RW
Reset	0	0	0	1	1	0	0	0								0

Bit(s)	Mnemonic	Name	Description
15:8		EXT_TIME	**Configurable extension time of start condition.** Time unit: 1/4*BASE_CLOCK_PERIOD *Note: The max. value is {0xFF-SAMPLE_CNT_DIV}.*
0	**EXT_EN**	EXT_EN	**Used for standard mode only** Baud rate is up to 100kHz. This option decides to perform the extension of start/stop condition. If enabled, perform the extension;

MEDIATEK CONFIDENTIAL

Bit(s)	Mnemonic	Name	Description
			others not. 0: Disable 1: Enable

11007030 **FIFO_STAT** **FIFO Status Register** **0001**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	**RD_ADDR**				**WR_ADDR**				**FIFO_OFFSET**						**WR_FULL**	**RD_EMPTY**
Type	RO				RO				RO						RO	RO
Reset	0	0	0	0	0	0	0	0	0	0	0	0			0	1

Bit(s)	Mnemonic	Name	Description
15:12	**RD_ADDR**	RD_ADDR	**Current RD address pointer** Only bit [2:0] has physical meaning.
11:8	**WR_ADDR**	WR_ADDR	**Current WR address pointer** Only bit [2:0] has physical meaning.
7:4	**FIFO_OFFSET**	FIFO_OFFSET	
1	**WR_FULL**	WR_FULL	**Indicates FIFO is full**
0	**RD_EMPTY**	RD_EMPTY	**Indicates FIFO is empty**

11007034 **FIFO_THRESH** **FIFO Thresh Register** **0700**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name						**TX_TRIG_THRESH**								**RX_TRIG_THRESH**		
Type						RW								RW		
Reset						1	1	1						0	0	0

Overview For debugging only. By default these values do not need to be adjusted. Note that for Rx, no time-out mechanism is implemented. Therefore, RX_trig_thresh must be left at 0, or there will be data left in FIFO that is not fetched by DMA controller.

Bit(s)	Mnemonic	Name	Description
10:8	**TX_TRIG_THRESH**	TX_TRIG_THRESH	When Tx FIFO level is below this value, Tx DMA request will be asserted.
2:0	**RX_TRIG_THRESH**	RX_TRIG_THRESH	When Rx FIFO level is above this value, Rx DMA request will be asserted.

11007038 **FIFO_ADDR_CLR** **FIFO Address Clear Register** **0000**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																**FIFO_ADDR_CLR**

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Type																WO
Reset																0

Bit(s)	Mnemonic	Name	Description
0	**FIFO_ADDR_CLR**	FIFO_ADDR_CLR	When written with 1, 1 pulse fifo_addr_clr will be generated to clear the FIFO address back to 0.

11007040 IO_CONFIG IO Config Register 0003

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name													IDLE_OE_EN	IO_SYNC_EN	SDA_IO_CONFIG	SCL_IO_CONFIG
Type													RW	RW	RW	RW
Reset													0	0	1	1

Overview Configures I/O for the SDA and SCL lines to select between normal I/O mode or open-drain mode to support wired-and bus.

Bit(s)	Mnemonic	Name	Description
3	**IDLE_OE_EN**	IDLE_OE_EN	0: Does not drive bus in idle state 1: Drive bus in idle state
2	**IO_SYNC_EN**	IO_SYNC_EN	**Reserved for debugging only** When set to 1, SCL and SDA inputs will be the first dual synced by bclk_ck. This should not be required.
1	**SDA_IO_CONFIG**	SDA_IO_CONFIG	0: Normal tristate I/O mode 1: Open-drain mode
0	**SCL_IO_CONFIG**	SCL_IO_CONFIG	0: Normal tristate I/O mode 1: Open-drain mode

11007044 DEBUG Reserved Debug Register 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name														DEBUG		
Type														RW		
Reset														0	0	0

Overview Note: This register is for debugging only. The bits are R/W. Do not change the default values.

Bit(s)	Mnemonic	Name	Description
2:0	**DEBUG**	DEBUG	

11007048 HS High Speed Mode Register 0102

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name		HS_SAMPLE_CNT_DIV				HS_STEP_CNT_DIV				MASTER_CODE					HS_NACKERR_DET_EN	HS_EN
Type		RW				RW				RW					RW	RW

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL

Reset		0	0	0		0	0	1		0	0	0			1	0

Overview Contains options for supporting high-speed operation features. Each HS half pulse width, i.e. each high or low pulse, is equal to (step_cnt_div+1)*(sample_cnt_div+1)/13MHz

Bit(s)	Mnemonic	Name	Description
14:12	**HS_SAMPLE_CNT_DIV**	HS_SAMPLE_CNT_DIV	**When high speed mode is entered after the master code transfer has been completed, the sample width will depend on this parameter.**
10:8	**HS_STEP_CNT_DIV**	HS_STEP_CNT_DIV	**When high speed mode is entered after the master code transfer has been completed, the number of samples per half pulse width will depend on this value.**
6:4	**MASTER_CODE**	MASTER_CODE	**3-bit programmable value for the master code to be transmitted**
1	**HS_NACKERR_DET_EN**	HS_NACKERR_DET_EN	**Enables NACKERR detection during the master code transmission** When enabled, if NACK is not received after master code has been transmitted, the transaction will be terminated with a STOP condition.
0	**HS_EN**	HS_EN	**Enables high speed transaction** *Note: rs_stop must be set to 1, too.*

11007050 **SOFTRESET** **Soft Reset Register** **0000**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																**SOFT_RESET**
Type																WO
Reset																0

Bit(s)	Mnemonic	Name	Description
0	**SOFT_RESET**	SOFT_RESET	When written with 1, 1 pulse soft reset will be used as synchronous reset to reset I2C internal hardware circuits.

11007054 **I2C0_I2CREG_HW_CG_EN** **HW DCM Enable** **0000**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																**DCM_EN**
Type																RW
Reset																0

Bit(s)	Mnemonic	Name	Description
0		DCM_EN	**Enables HW DCM function** Default: Disable 0: Disable 1: Enable

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL

11007064 DEBUGSTAT Debug Status Register 0020

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									BUS_BUSY	MASTER_WRITE	MASTER_READ	MASTER_STATE				
Type									RU	RU	RU	RU				
Reset									0	0	1	0	0	0	0	0

Bit(s)	Mnemonic	Name	Description
7	**BUS_BUSY**	BUS_BUSY	**For debugging only** Valid when bus_detect_en is 1. bus_busy = 1 indicates a start transaction has been detected and no stop condition has been detected yet.
6	**MASTER_WRITE**	MASTER_WRITE	**For debugging only** 1: Current transfer is in master write dir.
5	**MASTER_READ**	MASTER_READ	**For debugging only** 1: Current transfer is in master read dir.
4:0	**MASTER_STATE**	MASTER_STATE	**For debugging only** Reads back the current master_state. 0: Idle state 1: I2C master is preparing for sending out the start bit, SCL=1, SDA=1 2: I2C master is sending out the start bit, SCL=1, SDA=0 3: I2C master/slave is preparing for transmitting data bit, SCL=0, SDA=data bit (data bit can be changed when SCL=0) 4: I2C master/slave is transmitting data bit, SCL=1, SDA=data bit (data bit is stable when SCL=1) 5: I2C master/slave is preparing for transmitting ack bit, SCL=0, SDA=ack (ack bit can be changed when SCL=0) 6: I2C master/slave is transmitting ack bit, SCL=1, SDA=0 (ack bit is stable when SCL=1) 7: I2C master is preparing for sending out stop bit or repeated-start bit, SCL=0, SDA=0/1 (0: stop bit; 1: repeated-start bit) 8: I2C master is sending out stop bit or repeated-start bit, SCL=1, SDA=1/0 (1: stop bit; 0: repeated-start bit); 9: I2C master is in delay start between two transfers, SCL=1, SDA=1 10: I2C master is in FIFO wait state. For writing transaction, it means FIFO is empty and I2C master is waiting for DMA controller to write data into FIFO. For reading transaction, it means FIFO is full and I2C master is waiting for DMA controller reading data from FIFO, SCL=0, SDA=don't care 12: I2C master is preparing for sending out data bit of master code. This state is used only in high-speed transaction, SCL=0, SDA=data bit of master code (data bit of master code can be changed when SCL=0) 13: I2C master is sending out data bit of master code. This state is used only in high-speed transaction, SCL=1, SDA=data bit of master code (data bit of master code is stable when SCL=1) 14: I2C master/slave is preparing for transmitting nack bit, SCL=0, SDA=nack bit (nack bit can be changed when SCL=0). This state is used only in high-speed transaction. 15: I2C master/slave is transmitting nack bit, SCL=1, SDA=1; This state is used only in high-speed transaction.

11007068 DEBUGCTRL Debug Control Register 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Name															APB_DEBUG_RD	FIFO_APB_DEBUG
Type															WO	RW
Reset															0	0

Bit(s)	Mnemonic	Name	Description
1	APB_DEBUG_RD	APB_DEBUG_RD	**Valid only when fifo_apb_debug is set to 1. Writing to this register will generate a 1 pulsed FIFO APB RD signal for reading the FIFO data.**
0	FIFO_APB_DEBUG	FIFO_APB_DEBUG	**For trace 32 debugging** When trace 32 is used and the memory map is shown, turning on this bit will block the normal APB read access. APB read access to FIFO will then be enabled by writing to apb_debug_rd. 0: Disable 1: Enable

1100706C **TRANSFER_LEN_AUX** **Transfer Length Register (Number of Bytes per Transfer)** **0001**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	TRANSFER_LEN_AUX															
Type	RW															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit(s)	Mnemonic	Name	Description
15:0	TRANSFER_LEN_AUX	TRANSFER_LEN_AUX	**Valid only when dir_change or transfer_len_change is set to 1.** Indicates the number of data bytes to be transferred in 1 transfer unit (excluding slave address byte) for the transfers following the direction change. That is, if dir_change =1, the first write transfer length will depend on transfer_len, and the second read transfer length depends on transfer_len_aux. Dir change is always after the first transfer. *Note: The value must be set to be bigger than 1; otherwise no transfer will take place.*

5.11 Pulse-Width Modulation (PWM)

5.11.1 Introduction

Seven generic pulse-width modulators are implemented to generate pulse sequences with programmable frequency and duration for LCD backlight, charging or other purposes. Before enabling PWM, the pulse sequences must be prepared in the memory or registers. Then PWM will read the pulse sequences to generate random waveform to meet all kinds of applications (see Figure 5-21).

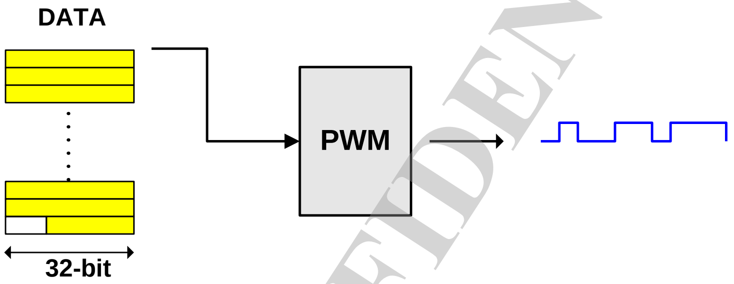

Figure 5-21. Generation procedure of PWM

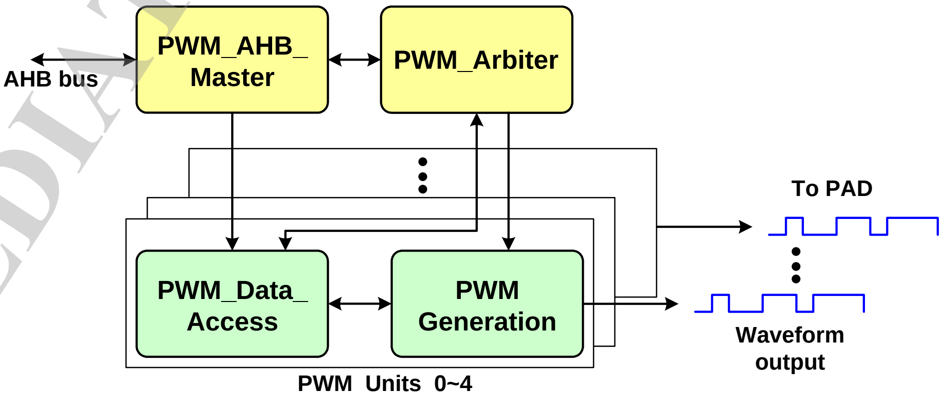
5.11.2 Features

- Old mode, FIFO mode
- Periodical memory and random mode
- Sequential output mode and 3DLCM mode

5.11.3 Block Diagram



5.11.4 Register Definition

Module name: PWM Base address: (+11006000h)

5.12 General-Purpose Timer (GPT)

5.12.1 Introduction

The GPT includes five 32-bit timers and one 64-bit timer. Each timer has four operation modes, which are ONE-SHOT, REPEAT, KEEP-GO and FREERUN, and can operate on one of the two clock sources, RTC clock (32.768kHz) and system clock (13MHz).

5.12.2 Features

The four operation modes for GPT are ONE-SHOT, REPEAT, KEEP-GO and FREERUN. See Table 5-6. ***Operation mode of GPT*** for the functions of each mode.

Table 5-6. Operation mode of GPT

Mode	Auto Stop	Interrupt	Increases when EN=1 and …	When COUNTn equals COMPAREn	Example: Compare is set to 2 **Bold means interrupt*
ONE-SHOT	Yes	Yes	Stops when COUNTn equals to COMPAREn	EN is reset to 0.	0,1,**2**,2,2,2,2,2,2,2,2,2,…
REPEAT	No	Yes		Count is reset to 0.	0,1,**2**,0,1,**2**,0,1,**2**,0,1,**2**…
KEEP-GO	No	Yes	Reset to 0 when overflow		0,1,**2**,3,4,5,6,7,8,9,10,…
FREERUN	No	No	Reset to 0 when overflow		0,1,2,3,4,5,6,7,8,9,10,…

Each timer can be programmed to select the clock source, RTC clock (32.76kHz) or system clock (13MHz). After the clock source is determined, the division ratio of the selected clock can be programmed. The division ratio can be fine-granulated as 1, 2, 3, 4 to 13 and coarse-granulated as 16, 32 and 64.

Bit(s)	Name	Description
31:0	COMPARE6H	Higher word of compare of GPT6

5.12.5 Programming Guide

To program and use GPT, note that:
The counter value can be read any time even when the clock source is RTC clock.

- The compare value can be programmed any time.

For the GPT6 64-bit timer, the read operation of the 64-bit timer value will be separated into two APB reads since an APB read is of 32-bit width. To perform the read of 64-bit timer value, the lower word should be read first then the higher word. The read operation of lower word freezes the “read value” of the higher word but does not freeze the timer counting. This ensures that the separated read operation acquires the correct timer value. If both two tasks, e.g. task A and task B, perform the read of 64-bit timer value, task A first reads the lower word of the value, and task B reads the lower word of the value. Either of the tasks reads the higher word of timer value, and the obtained value will be the time when task B reads the lower word of timer value. To guarantee task A reads the correct 64-bit timer value, some software procedures are required, e.g. the semaphore.

5.13 Thermal Controller

5.13.1 Introduction

On mobile platform, thermal management is very fundamental. The thermal management controls the platform computing performance to achieve the requirement and maintain the Raven within the temperature constraints. Operation under over-high temperature for a long time will have a risk of damage for Raven reliability.

In MT6735, it embeds several temperature sensors in possible hot spots on the die. The thermal controller module executes a periodic measurement for each hot spot. The temperature readings are readable for software.

In order to minimize the software effort nf temperature monitoring, the thermal controller generates interrupts to microprocessors which informs the abnormal condition.

5.13.2 Features

- Supports up to three thermal sensors
- Periodic temperature measurement
- Temperature monitoring
- Different types of low pass filters for thermal sensor reading

5.13.3 Block Diagram

There are four microprocessors in MT6735. Their maximum frequency is up to over 1.3GHz and the transistor count is also large. The power consumed by microprocessors occupies a high percentage of the entire chip power consumption. Besides the microprocessors, EMI is also a source of power consumption because it provides high DRAM data bandwidth to other modules in MT6735.

The thermal controller is implemented for the software to operate MT6735 with a pre-defined temperature range. Or it will have function failure and reliability issues. According to temperature measurement, the system performance can be adjusted and the system design for power dissipation can also be monitored.

The hottest location in MT6735 may be different in different applications. Besides, when the thermal controller informs the software of an abnormal condition, the following power reduction action should be an efficient and low latency.

In general, there are two methods for embedded CMOS temperature sensor:

- VBE temperature sensor
- ▵ VBE temperature sensor (PTAT temperature sensor)

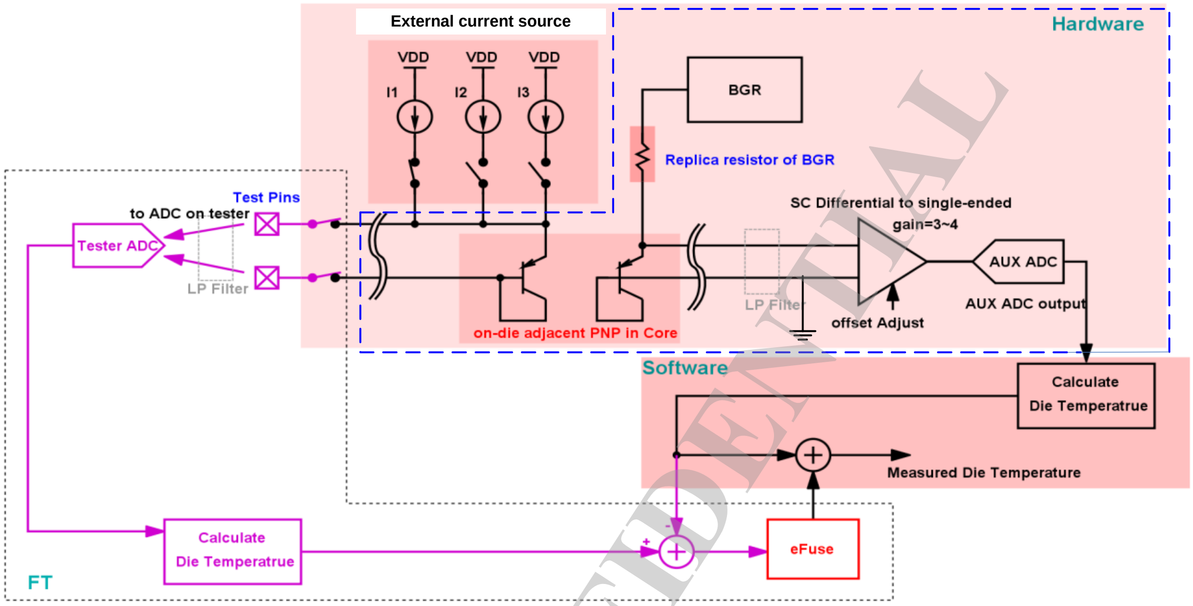

Figure 5-23. Implementation of CMOS temperature sensor

The accuracy target is 2°C when the temperature is in the range of 0 ~ 85°C. We use VBE as a CMOS sensor:

Consider

$$Ic = Is \cdot e^{\frac{V_{BE}}{\frac{nkT}{q}}}$$

$$\Rightarrow V_{BE} = \frac{nkT}{q} \cdot \ln \frac{I_C}{I_S}$$

- -1.665mV/°C in N40 process (TT, RTyp)

And use 12-bit SAR AUXADC for data conversion. The resolution of AUXADC is about $2.5V/2^{12}$= 0.6mV. But for △ VBE method,

△ VBE = nkT/q x lnN

- k/q=0.086mV/°C

The resolution of AUXADC is not enough.

Considering offset, we calibrate the offset in FT and use e-fuse to store the calibrated value.

- △ VBE based approach for die temperature offset calibration.

There is no need to wait for thermal equilibrium in FT. However, it needs unused PAD and external bias circuit in FT.

1. Consider the BJT series resistor,

$$\Delta V_{BE} = \frac{\beta}{1+\beta} R_S (I_{C_1} - I_{C_2}) + \frac{nkT}{q} \cdot \ln \frac{I_{C_1}}{I_{C_2}} \frac{I_{S_2}}{I_{S_1}} = \frac{\beta}{1+\beta} R_S (I_{C_1} - I_{C_2}) + \frac{nkT}{q} \ln \frac{N}{M}$$

2. By applying IC1, IC2 and IC3, the three different current in FT, we can get the following equation and solve it for RS and T.

$$\Delta V_{BE1} = \frac{\beta}{1+\beta} R_S (I_{C_2} - I_{C_1}) + \frac{nkT}{q} \ln N_1$$

$$\Delta V_{BE2} = \frac{\beta}{1+\beta} R_S (I_{C_3} - I_{C_2}) + \frac{nkT}{q} \ln N_2$$

- Comparing the T measured via on chip ADC and the T got in the above equations, we can calibrate the temperature offset.

5.13.4 Register Definition

Module name: ptp_therm_ctrl Base address: (+1100B000h)

Address	Name	Width	Register Function
1100B000	TEMPMONCTL0	32	Temperature Monitoring Control 0
1100B004	TEMPMONCTL1	32	Temperature Monitoring Control 1
1100B008	TEMPMONCTL2	32	**Temperature Monitoring Control 2** This register is fixed to 0 when RTC_POWERKEY1 & RTC_POWERKEY2 unmatch the correct values.
1100B00C	TEMPMONINT	32	Temperature Monitoring Interrupt Enable
1100B010	TEMPMONINTSTS	32	Temperature Monitoring Interrupt Status
1100B014	TEMPMONIDET0	32	Sensing Point 0 Temperature Monitoring Detection
1100B018	TEMPMONIDET1	32	Sensing Point 1 Temperature Monitoring Detection
1100B01C	TEMPMONIDET2	32	Sensing Point 2 Temperature Monitoring Detection
1100B024	TEMPH2NTHRE	32	Temperature HOT2NORMAL Threshold
1100B028	TEMPHTHRE	32	Temperature Hot Threshold
1100B02C	TEMPCTHRE	32	Temperature Cold Threshold
1100B030	TEMPOFFSETH	32	Temperature High Offset Threshold
1100B034	TEMPOFFSETL	32	Temperature Low Offset Threshold
1100B038	TEMPMSRCTL0	32	Temperature Measure Control 0
1100B03C	TEMPMSRCTL1	32	Temperature Measure Control 1
1100B040	TEMPAHBPOLL	32	Temperature AHB Polling
1100B044	TEMPAHBTO	32	Temperature AHB Polling Timeout
1100B048	TEMPADCPNP0	32	ADC Mux Selection Value
1100B04C	TEMPADCPNP1	32	ADC Mux Selection Value

MEDIATEK CONFIDENTIAL

5.14 IRTX

5.14.1 Introduction

IRTX module provides the “Consumer IR” feature. According to Wikipedia, *“Consumer IR, consumer infrared, or CIR, refers to a wide variety of devices employing the infrared electromagnetic spectrum for wireless communications. Most commonly found in television remote controls, infrared ports are equally ubiquitous in consumer electronics, such as PDAs, laptops, and computers. The functionality of CIR is as broad as the consumer electronics that carry it. For instance, a television remote control can convey a "channel up" command to the television, while a computer might be able to surf the internet solely via CIR. The type, speed, bandwidth, and power of the transmitted information depends on the particular CIR protocol employed.”*

MediaTek’s IRTX provides three main stream CIR protocols: NEC, RC5 and RC6. It also supports Android IR API in which the OS version is above KitKat.

5.14.2 NEC Protocol

5.14.2.1 Introduction

The NEC protocol uses pulse distance encoding of the bits. Each pulse is a 560µs long 38kHz carrier burst (about 21 cycles). A logical "1" takes 2.25ms to transmit, while a logical "0" takes only half of that, i.e. 1.125ms, as shown in Figure 5-26. The recommended carrier duty-cycle is 1/4 or 1/3.

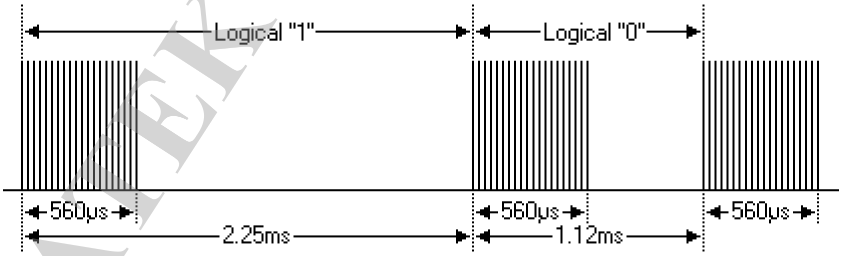

Figure 5-26. Logic representation for NEC protocol

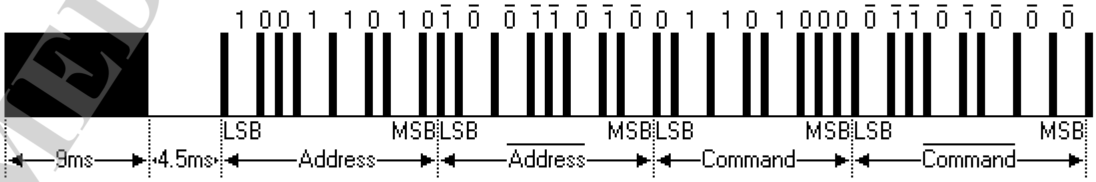

Figure 5-27. Pulse train in transmission of NEC protocol

The picture above shows the typical pulse train of the NEC protocol. With this protocol, the LSB is transmitted first. In this case Address $59 and Command $16 is transmitted. A message is started by a

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

9ms AGC burst, which is used to set up the gain of the earlier IR receivers. This AGC burst is then followed by a 4.5ms space, which is then followed by the Address and Command. Address and Command are transmitted twice. In the second time, all bits are inverted and can be used for verification of the received message. The total transmission time is constant because every bit is repeated with its inverted length.

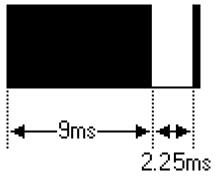

Figure 5-28. A message is started by a 9ms AGC burst

A command is transmitted only once even when the key on the remote control remains pressed. Every 110ms a repeat code is transmitted for as long as the key remains down. This repeated code is simply a 9ms AGC pulse followed by a 2.25ms space and a 560µs burst.

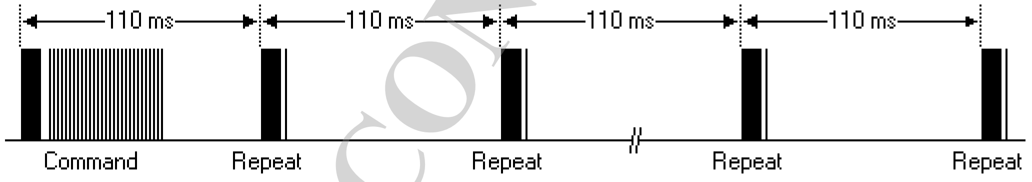

Figure 5-29. A repeat code is transmitted every 110ms

5.14.2.2 Features

- 8-bit address and 8-bit command length
- Address and command are transmitted twice for reliability.
- Pulse distance modulation
- 38kHz carrier frequency
- 1.125ms or 2.25ms bit time

5.14.3 Philips RC-5 Protocol

5.14.3.1 Introduction

The protocol uses bi-phase modulation (or so-called Manchester coding) of a 36kHz IR carrier frequency. All bits are of equal length to 1.778ms in this protocol, with half of the bit time filled with a burst of the 36kHz carrier and the other half being idle. A logical zero is represented by a burst in the first half of the bit time. A logical one is represented by a burst in the second half of the bit time. The pulse/pause ratio of the 36kHz carrier frequency is 1/3 or 1/4 to reduce power consumption.

MEDIATEK CONFIDENTIAL

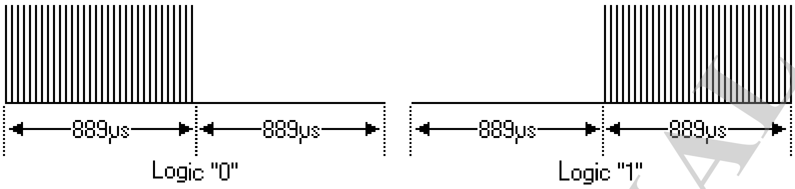

Figure 5-30. Coding method for RC5 protocol

5.14.3.2 Features

- 5-bit address and 6-bit command length (7 command bits for RC5X)
- Bi-phase coding (aka Manchester coding)
- 36kHz carrier frequency
- 1.778ms constant bit time (64 cycles of 36 kHz)
- Manufacturer Philips

5.14.4 Philips RC-6 Protocol

5.14.4.1 Introduction

RC-6 is the successor of the RC-5 protocol. Like RC-5 the new RC-6 protocol is also defined by Philips. It is a very versatile and well defined protocol. Because of this versatility its original definition is many pages long. Here we only summarize the most important properties of this protocol. RC-6 signals are modulated on a 36kHz Infra Red carrier. The duty cycle of this carrier has to be between 25% and 50%.

Data are modulated using Manchester coding; this means that each bit (or symbol) has both a mark and space in the output signal. If the symbol is a "1", the first half of the bit time will be a mark and the second half a space. If the symbol is a "0", the first half of the bit time will be a space and the second half a mark.

The main timing unit is 1t, which is 16 times the carrier period (1/36k*16 = 444µs). With RC-6, total different symbols are defined:

- The leader pulse has a 6t mark time (2.666ms) and 2t space time (0.889ms). This leader pulse is normally used to set up the gain of the IR receiver unit.

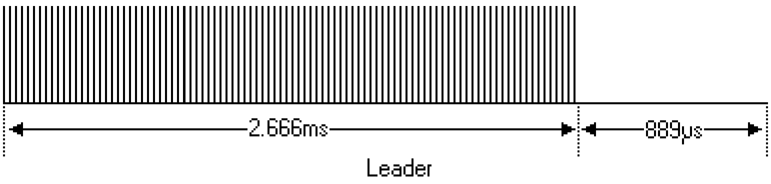

Figure 5-31. Lead pulse in RC6 protocol

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL

- Normal bits have 1t mark time (0.444ms) and 1t space time (0.444ms). "0" and "1" are encoded by the position of the mark and space in the bit time.

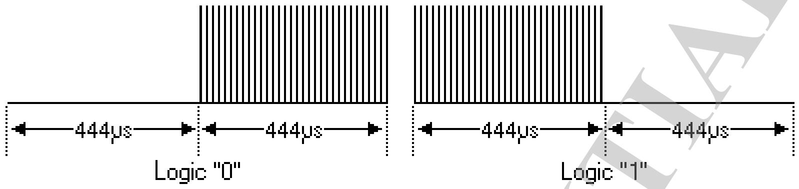

Figure 5-32. Coding method for RC6 protocol

- Trailer bits have 2t mark time (0.889ms) and 2t space time (0.889ms). "0" and "1" are encoded by the position of the mark and space in the bit time.

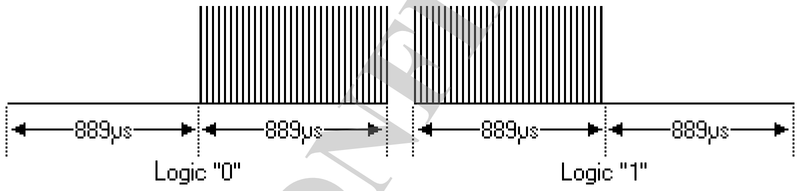

Figure 5-33. Trailer pulse in RC6 protocol

The leader and trailer symbols are only used in the header field of the messages.

5.14.4.2 Features

- Different modes of operation, depending on the intended use
- Dedicated Philips modes and OEM modes
- Variable command length, depending on the operation mode
- Bi-phase coding (aka Manchester coding)
- 35kHz carrier frequency
- Manufacturer Philips

5.15 IrDA

5.15.1 Introduction

IrDA framer, which is shown in Figure 5-34, is implemented to reduce the CPU loading for IrDA transmission. The IrDA framer functional block can be divided into two parts: (1) the transmitting part and (2) the receiving part. The transmitter part performs BOFs addition, byte stuffing, the addition of 16-bits FCS, and EOF appendence. The receiving part executes BOFs removal, ESC character removal, CRC checking, and EOF detection. In addition, the framer will perform 3/16 modulation and demodulation to connect to the IR transceiver. The transmitter and receiver need the DMA channel.

5.15.2 Features

- The IrDA framer supports IrDA SIR, MIR and FIR modes of operation.
- SIR mode includes operation from 9600bps ~ 115200bps.
- MIR includes operation at 567000bps or 1152000bps
- FIR mode includes operation at 4Mbps.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									BUF							
Type									RW							
Reset									0	0	0	0	0	0	0	0

Bit(s)	Mnemonic	Name	Description
7:0	BUF	BUF	IrDA framer transmit or receive data

11010004 BUF_CLEAR Tx BUF and Rx BUF Clear Signal 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																CLEAR
Type																RO
Reset																0

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Mnemonic	Name	Description
0	**CLEAR**	CLEAR	**SIR mode only** When CLEAR = 1, both Tx and Rx FIFO will be cleared. Used primarily for debugging. Normal operation does not require this. This control signal can only be issued in SIR mode.

11010008 **MAX_T** **Max. Turn-around Time** **3E80**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name			MAX_T													
Type			RW													
Reset			1	1	1	1	1	0	1	0	0	0	0	0	0	0

Bit(s)	Mnemonic	Name	Description
13:0	**MAX_T**	MAX_T	**Max. time a station can hold the P/F bit** This parameter, along with the baud rate parameter, dictates the maximum number of bytes that a station can transmit before passing the line to another station by transmitting a frame with the P/F bit. This parameter is used by one station to indicate the maximum time the other station can send before it must turn the link around. For baud rates less than 115,200kbps, 500ms is the only valid value. Default: 500ms

1101000C **MIN_T** **Min. Turn-around Time** **FDE8**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	MIN_T															
Type	RW															
Reset	1	1	1	1	1	1	0	1	1	1	1	0	1	0	0	0

Bit(s)	Mnemonic	Name	Description
15:0	**MIN_T**	MIN_T	**Min. turn-around time** Default: 10ms. The minimum turnaround time parameter deals with the time needed for a receiver to recover following saturation by transmission from the same device. This parameter corresponds to the required time delay between the last byte of the last frame sent by a station and the point at which it is ready to receive the first byte of a frame from another station, i.e. the latency for a transmit to complete and be ready to receive.

11010010 **BOFS** **Number of Additional BOFs Prefixed to the Beginning of a Frame** **000B**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									TYPE	BOFS						
Type									RW	RW						
Reset									0	0	0	0	1	0	1	1

Bit(s)	Mnemonic	Name	Description

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL

Bit(s)	Mnemonic	Name	Description
7	**TYPE**	TYPE	**SIR mode only. Additional BOFs type** 0: BOF = FFh 1: BOF = C0h
6:0	**BOFS**	BOFS	**For SIR mode: The additional BOFs parameter indicates the number of additional flags needed at the beginning of every frame.** The main purpose for the additional BOFs is to provide a delay at the beginning of each frame for devices with a long interrupt latency. **For MIR mode: This parameter indicates the number of double STA's to transmit in the beginning.** This value should be set to 0 (for default 2 STA's) for MIR mode, unless more are required. **For FIR mode: This parameter has no effect.**

11010014 DIV Baud Rate Divisor 0055

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	DIV															
Type	RW															
Reset	0	0	0	0	0	0	0	0	0	1	0	1	0	1	0	1

Bit(s)	Mnemonic	Name	Description
15:0	**DIV**	DIV	**Transmit or receive rate divider** SIR mode: DIV Rate = System clock frequency/DIV/16. The default value is 55h when in contention mode. MIR/FIR mode: DIV Rate = 1. This divisor is also used to determine the RX FIFO timeout threshold.

11010018 TX_FRAME_SIZE Transmit Frame Size 0040

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit(s)	Mnemonic	Name	Description
11:0	**RX_FRAME1_SIZE**	RX_FRAME1_SIZE	**Reports the number of byte received** Includes only the A+C+I fields.

11010020 ABORT Transmit Abort Indication 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																ABORT
Type																RW
Reset																0

Bit(s)	Mnemonic	Name	Description
0	**ABORT**	ABORT	**SIR mode only** When set to 1, the framer transmits an abort sequence and closes the frame without an FCS field or an ending flag. *Note: Tx abort can be achieved in MIR and FIR by simply disabling the tx_en signal.*

11010024 TX_EN IrDA Framer Transmit Enable Signal 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name													TX_ONE	TXINVERT	MODE	TX_EN
Type													RW	RW	RW	RW
Reset													0	0	0	0

Bit(s)	Mnemonic	Name	Description
3	**TX_ONE**	TX_ONE	**Controls the transmit enable signal (one or not one)** 0: tx_en is not de-asserted until software programs do so. 1: tx_en is de-asserted (i.e. transmit is disabled) automatically after one frame has been sent.
2	**TXINVERT**	TXINVERT	**Inverts transmit signal** 0: Transmit signal is not inverted. 1: Transmit signal is inverted.
1	**MODE**	MODE	**SIR mode only. Selects modulation type** 0: 3/16 modulation 1: 1.61us
0	**TX_EN**	TX_EN	**Enables transmission**

11010028 RX_EN IrDA Framer Receive Enable Signal 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name														RX_ONE	RXINVERT	RX_EN
Type														RW	RW	RW
Reset														0	0	0

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Mnemonic	Name	Description
2	**RX_ONE**	RX_ONE	**Disables receiving when one frame is acquired** 0: rx_en is not de-asserted until software programs do so. 1: rx_en is de-asserted (i.e. transmit disabled) automatically after one frame has been sent.
1	**RXINVERT**	RXINVERT	**Inverts the received signal** 0: Received signal is not inverted. 1: Received signal is inverted.
0	**RX_EN**	RX_EN	**Enables receiving**

11010002C **TRIGGER** **FIFO Trigger Level Indication** **0000**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name													RX_TRIG		TX_TRIG	
Type													RW		RW	
Reset													0	0	0	0

Bit(s)	Mnemonic	Name	Description
3:2	**RX_TRIG**	RX_TRIG	**Rx FIFO interrupt trigger threshold** When the amount of data in Rx FIFO is above the specified amount, DMA req is asserted. 0: 1 byte 1: 2 bytes 2: 3 bytes
1:0	**TX_TRIG**	TX_TRIG	**Tx FIFO interrupt trigger threshold** When the amount of data in the Tx FIFO is less than the specified amount, DMA req is asserted. (When TX_TRIG = 03, DMA req is always asserted as long as FIFO is not full.) 0: 0 byte 1: 1 byte 2: 8 bytes 3: 16 bytes

11010030 **IRQ_ENABLE** **IRQ Enabling Signal** **0000**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name				2NDRX_COMP	RXRESTART	THRESHTIMEOUT	FIFOTIMEOUT	TXABORT	RXABORT	MAXTIMEOUT	MINTIMEOUT	RXCOMPLETE	TXCOMPLETE	ERROR	RXTHRES	TXTHRES
Type				RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit(s)	Mnemonic	Name	Description
12	**2NDRX_COMP**	_2NDRX_COMP	**Receives second frame and gets P/F bit** 0: No interrupt is generated 1: Interrupt is generated when receiving second frame and P/F bit is completely obtained.
11	**RXRESTART**	RXRESTART	**SIR mode only. Receives a new frame before one frame is received completely** 0: No interrupt is generated. 1: Interrupt is generated when receiving a new frame and before one

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Mnemonic	Name	Description
			frame has been completely received.
10	**THRESHTIMEOUT**	THRESHTIMEOUT	**Threshold time time-out** 0: No interrupt is generated. 1: Interrupt is generated when the threshold timer is timed out.
9	**FIFOTIMEOUT**	FIFOTIMEOUT	**FIFO time-out** 0: No interrupt is generated. 1: Interrupt is generated upon FIFO time-out.
8	**TXABORT**	TXABORT	**SIR mode only. Transmits aborting frame** 0: No interrupt is generated. 1: Interrupt is generated when transmitting an aborting frame.
7	**RXABORT**	RXABORT	**Receives aborting frame** 0: No interrupt is generated. 1: Interrupt is generated when receiving an aborting frame.
6	**MAXTIMEOUT**	MAXTIMEOUT	**Max. time time-out** 0: No interrupt is generated. 1: Interrupt is generated when the maximum timer is timed out.
5	**MINTIMEOUT**	MINTIMEOUT	**Min, time time-out.** 0: No interrupt is generated. 1: Interrupt is generated when the minimum timer is timed out.
4	**RXCOMPLETE**	RXCOMPLETE	**Receives one frame completely** 0: No interrupt is generated. 1: Interrupt is generated when one frame is completely received.
3	**TXCOMPLETE**	TXCOMPLETE	**Transmits one frame completely** 0: No interrupt is generated. 1: Interrupt is generated when one frame has been completely transmitted.
2	**ERROR**	ERROR	**Enables error status interrupt** 0: No interrupt is generated. 1: Interrupt is generated when an error status occurs.
1	**RXTHRES**	RXTHRES	**Received data reach the threshold level** For debugging only. Should be set to 0. 0: No interrupt is generated. 1: Interrupt is generated when receive FIFO size reaches its threshold.
0	**TXTHRES**	TXTHRES	**Transmitted data reach the threshold level** For debugging only. Should be set to 0. 0: No interrupt is generated. 1: Interrupt is generated when transmit FIFO size reaches it threshold.

11010034 **IRQ_STA** **Interrupt Status** **0000**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name				2ND RX_COMP	RXREST ART	THRESHTIMEOUT	FIFOTIMEOUT	TXABORT	RXABORT	MAXTIMEOUT	MINTIMEOUT	RXCOMPLETE	TXCOMPLETE	ERROR	RXTHRES	TXTHRES
Type				RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC
Reset				0	0	0	0	0	0	0	0	0	0	0	0	0

Bit(s)	Mnemonic	Name	Description
12	**2NDRX_**	_2NDRX_COMP	**Receives second frame and completely obtains the P/F bit**

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Mnemonic	Name	Description
	COMP		
11	**RXRESTART**	RXRESTART	**Receives a new frame before one frame is completely received**
10	**THRESHTIMEOUT**	THRESHTIMEOUT	**Threshold time time-out**
9	**FIFOTIMEOUT**	FIFOTIMEOUT	**FIFO time-out has occurred**
8	**TXABORT**	TXABORT	**Transmits an aborting frame**
7	**RXABORT**	RXABORT	**Receives an aborting frame**
6	**MAXTIMEOUT**	MAXTIMEOUT	**Max. turn-around time time-out**
5	**MINTIMEOUT**	MINTIMEOUT	**Min. turn-around time time-out**
4	**RXCOMPLETE**	RXCOMPLETE	**One frame completely received**
3	**TXCOMPLETE**	TXCOMPLETE	**One frame completely transmitted**
2	**ERROR**	ERROR	**Generated when any of status in error status register occurs** Once the source of an interrupt is determined to be caused by an error (bit 2), the error status register should be read. Once read, both the error status register and the interrupt source are read-cleared. If the error status register indicates either a frame 1 or frame 2 error, the corresponding frame status register should be read.
1	**RXTHRES**	RXTHRES	**Receives when FIFO reaches threshold** For debugging only. Not recommended for normal usage.
0	**TXTHRES**	TXTHRES	**Transmits when FIFO reaches threshold** For debugging only. Not recommended for normal usage.

11010038 **ERR_STATUS** **Error Status Register** **0000**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name										TXFIFOUNDERRUN	FRAME2DATAERR	FRAME1DATAERR	RESERVED2	RESERVED	OVERRUN	RXSIZE
Type										RC	RC	RC	RC	RC	RC	RC
Reset										0	0	0	0	0	0	0

Bit(s)	Mnemonic	Name	Description
6	**TXFIFOUNDERRUN**	TXFIFOUNDERRUN	**MIR and FIR mode only** Tx FIFO under run has occurred. Data transmission is aborted. Software must reset the tx_en signal.
5	**FRAME2DATAERR**	FRAME2DATAERR	**Indicates an error condition occurred in Rx frame 2** Must check the RX frame 2 status.
4	**FRAME1**	FRAME1DATAE	**Indicates an error condition occurred in RX frame 1**

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Mnemonic	Name	Description
	DATAERR	RR	Must check the RX frame 1 status.
1	OVERRUN	OVERRUN	**Frame overrun**
0	RXSIZE	RXSIZE	**Received frame size error**

1101003C **TRANSCEIVER_PDN** **Transceiver Power On/Off Control Selects transceiver mode** **0000**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name														TXCVRCONFIG	TXMANUAL	TRANS_PDN
Type														RW	WO	WO
Reset														0	0	0

Bit(s)	Mnemonic	Name	Description
2	TXCVRCONFIG	TXCVRCONFIG	0: Irda_txd comes from core logic. 1: Irda_txd depends on tx_manual value.
1	TXMANUAL	TXMANUAL	When txcvr config is set to 1, this bit can be used to select the operation mode of the external IrDA transceiver (some transceivers require selection between high speed and low speed operating modes by software programming the desired sequence to transmit through the irda_txd pin)
0	TRANS_PDN	TRANS_PDN	Used for power on/off control for the external IrDA transceiver

11010040 **RX_FRAME_MAX** **Max. Number of Receiving Frame Size** **0000**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name					MAX_RX_FRAME_SIZE											
Type					RW											
Reset					0	0	0	0	0	0	0	0	0	0	0	0

Bit(s)	Mnemonic	Name	Description
11:0	MAX_RX_FRAME_SIZE	MAX_RX_FRAME_SIZE	**Received frame I field max size** When the actual receiving frame size is larger than the rx_frame_max, RXSIZE will be asserted. The maximum allowed I field size is 2,048.

11010044 **THRESH_T** **Threshold Time** **0BB8**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	DISCONNECT_TIME

Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL

Bit(s)	Mnemonic	Name	Description
15:0	**DISCONNECT_TIME**	DISCONNECT_TIME	**Threshold time** Used to control the time a station waits without receiving a valid frame before disconnecting the link. Associated with this is the time a station waits without receiving a valid frame before sending a status indication to the service user layer.

11010048 **COUNT_ENABLE** **Counter Enabling Signal** **0000**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name														THRESH_EN	MIN_EN	MAX_EN
Type														RW	RW	RW
Reset														0	0	0

Bit(s)	Mnemonic	Name	Description
2	**THRESH_EN**	THRESH_EN	Enables threshhold_time_counter to increment
1	**MIN_EN**	MIN_EN	Enables min_turn_around_counter to increment
0	**MAX_EN**	MAX_EN	Enables max_turn_around_counter to increment

1101004C **CLOCK_RATE** **Indication of System Clock Rate** **0000**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name															CLOCK_RATE	
Type															RW	
Reset															0	0

Bit(s)	Mnemonic	Name	Description
1:0	**CLOCK_RATE**	CLOCK_RATE	**SIR mode. Indicates system clock rate** 0: 26MHz 1: 52MHz 2: 13MHz

11010050 **RATE_FIX** **System Clock Rate Fix** **0000**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name											FIR_RX_SYN_VALUE	MIR_TIMING_TUNE		CRC_REPORT	SIR_FRAMING_SET	RATE_FIX
Type											RW	RW		RW	RW	RW
Reset											0	0	0	0	0	0

Bit(s)	Mnemonic	Name	Description
5	**FIR_RX_**	FIR_RX_SYN_V	0: Does not adjust the sync value

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Mnemonic	Name	Description
	SYN_VALUE	ALUE	1: Adjust the sync value
4:3	**MIR_TIMING_TUNE**	MIR_TIMING_TUNE	**MIR mode only. For some transceivers, in MIR 0.576mbps mode, the RX output pulse does not conform to IRDA specification. Therefore, this option is used to detect the RX output from those transceivers correctly.** 0: For transceivers that conform to spec. 1: For transceivers that do not conform to spec, and the RX output pulse is half of that specified. 2: For transceivers that do not conform to spec, and the RX output pulse is quarter of that specified.
2	**CRC_REPORT**	CRC_REPORT	**When set to 1, CRC error is reported via error status register and error interrupt.**
1	**SIR_FRAMING_SET**	SIR_FRAMING_SET	**SIR mode only. Framing error check condition.** 0: Ignore the STOP bit of the last byte of a frame. 1: Check the STOP bit of the last byte of a frame.
0	**RATE_FIX**	RATE_FIX	**SIR mode only. Fix the IrDA framer sample base clock rate as 13MHz.** 0: Clock rate based on clock_rate selection. 1: Clock rate fixed at 13MHz.

11010054 **FRAME1_STATUS** **Rx Frame 1 Status** **0000**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reset									0	0	0	0	1	1	0	0

Bit(s)	Mnemonic	Name	Description
7:0	FIR_DIV	FIR_DIV	**Generates FIR sampling clock** A clock which is a multiple to 8 is needed for FIR. In an earlier design, the clock is 48MHz. In the MT6276, this clock is set to 104MHz. This register has been designed to divide the high speed clock to 8MHz. For example: if the clock is 104MHz, this register shall be set to 12. (104/(12+1) = 8). In the MT6276_E2, this clock is set to 48MHz. If the input clock is 48MHz, this register shall be set to 5. (48/(5+1) = 8)

5.16 Audio System

5.16.1 Introduction

The audio system provides the audio data exchange ability between AP, internal modem and external components. The interfaces are list as follows:

Master/Slave I2S input interface with SRC x 1
Master I2S output x 2
Master I2S input x 1
Slave PCM interface for internal MODEM x 1
Master/Slave PCM interface with SRC for internal/external MODEM x 1
Proprietary audio interface for MTK PMIC x 1
PCM/I2S merged interface for MTK connectivity IC x 1

5.16.2 Features

- Audio playing
  - Supports 8, 11.025, 12, 16, 22.05, 24, 32, 44.1, and 48kHz sampling rate output
  - Supports playing stereo data
- Audio recording
  - Supports 8, 16, 32, 48kHz sampling rate recording
  - Supports stereo recording
- Speech
  - Supports dual MIC
  - Supports 8/16kHz sampling rate recording
  - Supports side tone filter
  - Master/Slave PCM interface with SRC function
- I2S
  - Supports master/slave input mode
  - Supports master output mode
  - Supports 16/24-bit stereo data
  - Supports 8, 11.025, 12, 16, 22.05, 24, 32, 44.1, 48, 88.2, 96, 176.4, and 192kHz sampling rate in master mode
  - Supports EIAJ/I2S format
- PCM/I2S merged interface
  - 4-pin interface for concurrently supporting I2S and PCM
  - PCM supports 8k/16k Hz sampling rate
  - I2S supports 32, 44.1, and 48 kHz sampling rate
- Hardware gain function with higher resolution to enhance the audio quality and flexibility of interconnection
- Flexible interconnection system to make data exchange between interfaces without intervention of CPU

5.16.4 Register Definition

Module name: audio_sys_top Base address: (+11220000h)

Address	Name	Width	Register Function
11220000	AUDIO_TOP_CON0	32	**Audio Top Control Register 0** Top configuration for Audiosys. Set the PDN bit to 0 while initializing those blocks. Suggested value: 0x60004000
11220004	AUDIO_TOP_CON1	32	**Audio Top Control Register 1**
1122000C	AUDIO_TOP_CON3	32	**Audio Top Control Register 3**
11220010	AFE_DAC_CON0	32	**AFE Control Register 0** Switch for audio blocks
11220014	AFE_DAC_CON1	32	**AFE Control Register 1** Sets up the operation mode for each block.
11220018	AFE_I2S_CON	32	**AFE I2S Control Register 0** Control register for I2S. Suggested Value: 0x1d
1122001C	AFE_DAIBT_CON0	32	**AFE DAI/BT Control Register 0**
11220020	AFE_CONN0	32	**AFE Connection Register 0** Sets up the operation for interconnection blocks.
11220024	AFE_CONN1	32	**AFE Connection Register 1** Sets up the operation for interconnection blocks.
11220028	AFE_CONN2	32	**AFE Connection Register 2** Sets up the operation for interconnection blocks.
1122002C	AFE_CONN3	32	**AFE Connection Register 3** Sets up the operation for interconnection blocks.
11220030	AFE_CONN4	32	**AFE Connection Register 4**
11220034	AFE_I2S_CON1	32	**AFE I2S Control Register 1** Control register for the 2nd I2S, which is output only. Suggested value: 0x0009.
11220038	AFE_I2S_CON2	32	**AFE I2S Control Register 2** Control register for the 3rd I2S, which is input only. Suggested value: 0x08000009.
1122003C	AFE_MRGIF_CON	32	**AFE Merge Interface Control Register**
11220040	AFE_DL1_BASE	32	**AFE DL1 Base Address Register** Sets up the base address of the DL1 input in master mode.
11220044	AFE_DL1_CUR	32	**AFE DL1 Cursor Register** Indicates the current address of the DL1 input buffer.
11220048	AFE_DL1_END	32	**AFE_DL1_END** Sets up the end address of the DL1 input in master mode.
1122004C	AFE_I2S_CON3	32	**AFE I2S Control Register 3** Control register for the 4th I2S, which is output only. Suggested value: 0x0009.
11220050	AFE_DL2_BASE	32	**AFE DL2 Base Address Register** Sets up the base address of the DL2 input in master mode.
11220054	AFE_DL2_CUR	32	**AFE DL2 Cursor Register** Indicates the current address of the DL2 input buffer.
11220058	AFE_DL2_END	32	**AFE_DL2_END** Sets up the end address of the DL2 input in master mode.
1122005C	AFE_CONN5	32	**AFE Connection Register 5** Sets up the operation for interconnection blocks.

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Address	Name	Width	Register Function
1122006C	AFE_CONN_24BIT	32	**AFE Connection 24-bit Register** Sets up the operation for interconnection blocks.
11220070	AFE_AWB_BASE	32	**AFE AWB Base Address Register** Sets up the base address of the AWB input in master mode.
11220078	AFE_AWB_END	32	**AFE AWB End Address Register** Sets up the end address of the AWB input in master mode.
1122007C	AFE_AWB_CUR	32	**AFE AWB Cursor Register** Indicates the current address of the AWB input buffer.
11220080	AFE_VUL_BASE	32	**AFE VUL Base Address Register** Sets up the base address of the VUL input in master mode.
11220088	AFE_VUL_END	32	**AFE VUL End Address Register** Sets up the end address of the VUL input in master mode.
1122008C	AFE_VUL_CUR	32	**AFE VUL Cursor Register** Indicates the current address of the VUL input buffer.
11220090	AFE_DAI_BASE	32	**AFE DAI Base Address Register** Sets up the base address of the DAI input in master mode.
11220098	AFE_DAI_END	32	**AFE_DAI_END** Sets up the end address of the DAI input in master mode.
1122009C	AFE_DAI_CUR	32	**AFE DAI Cursor Register** Sets up the end address of the DAI input in master mode.
112200BC	AFE_CONN6	32	**AFE Connection Register 6** Sets up the operation for interconnection blocks.
112200CC	AFE_MEMIF_MSB	32	**AFE Memory Interface MSB Register**
112200D0	AFE_MEMIF_MON0	32	**AFE Memory Interface Monitor Register 0** Monitors DL1 memory interface output.
112200D4	AFE_MEMIF_MON1	32	**AFE Memory Interface Monitor Register 1** Monitors DL2 memory interface output.
112200D8	AFE_MEMIF_MON2	32	**AFE Memory Interface Monitor Register 2** Monitors VUL/DAI memory interface input.
112200E0	AFE_MEMIF_MON4	32	**AFE Memory Interface Monitor Register 4** Monitors AWB memory interface input.
11220108	AFE_ADDA_DL_SRC2_CON0	32	AFE_DL_SRC2 Control Register 0
1122010C	AFE_ADDA_DL_SRC2_CON1	32	AFE_DL_SRC2 Control Register 1 Part
11220114	AFE_ADDA_UL_SRC_CON0	32	AFE Uplink SRC Control Register 0 Part
11220118	AFE_ADDA_UL_SRC_CON1	32	AFE Uplink SRC Control Register 1 Part
11220120	AFE_ADDA_TOP_CON0	16	**AFE Top Control Register 0** Control register for loopback test
11220124	AFE_ADDA_UL_DL_CON0	16	Audio UL and DL Control Register 0
1122012C	AFE_ADDA_SRC_DEBUG	32	AFE UL Debug Control
11220130	AFE_ADDA_SRC_DEBUG_MON0	32	AFE Uplink SRC Monitor Register 0
11220134	AFE_ADDA_SRC_DEBUG_MON1	32	AFE Downlink SRC Monitor Register 1
112201D0	AFE_SIDETONE_DEBUG	32	Side-tone Debug
112201D4	AFE_SIDETONE	32	Side-tone Debug Monitor

This document contains information that is proprietary to MediaTek Inc.

Address	Name	Width	Register Function
	_MON		
112201E0	AFE_SIDETONE_CON0	32	Side-tone Control Port 0
112201E4	AFE_SIDETONE_COEFF	32	Side-tone coefficient Port
112201E8	AFE_SIDETONE_CON1	32	Side-tone Control Port 1
112201EC	AFE_SIDETONE_GAIN	32	Side-tone Gain Port
112201F0	AFE_SGEN_CON0	32	AFE Sine-wave Gen Config 0
11220200	AFE_TOP_CON0	32	AFE Top Control Register 0
11220260	AFE_ADDA_PREDIS_CON0	32	AFE Pre-distortion Control Port 0 High Part
11220264	AFE_ADDA_PREDIS_CON1	32	AFE Pre-distortion Control Port 1 High Part
11220270	AFE_MRGIF_MON0	32	AFE Merge Interface Monitor Register 0
11220274	AFE_MRGIF_MON1	32	AFE Merge Interface Monitor Register 1
11220278	AFE_MRGIF_MON2	32	AFE Merge Interface Monitor Register 2
11220330	AFE_MOD_DAI_BASE	32	**AFE MOD_DAI Base Address Register** Sets up the base address of the MOD_DAI input in master mode.
11220338	AFE_MOD_DAI_END	32	**AFE_MOD_DAI_END** Sets up the end address of the MOD_DAI input in master mode.
1122033C	AFE_MOD_DAI_CUR	32	**AFE MOD_DAI Cursor Register** Sets up the end address of the MOD_DAI input in master mode.
112203A0	AFE_IRQ_MCU_CON	32	AFE IRQ MCU Control Register
112203A4	AFE_IRQ_MCU_STATUS	32	AFE IRQ MCU Status Register
112203A8	AFE_IRQ_MCU_CLR	32	AFE IRQ Clear Register
112203AC	AFE_IRQ_MCU_CNT1	32	AFE IRQ1 MCU Counter Register
112203B0	AFE_IRQ_MCU_CNT2	32	AFE IRQ2 MCU Counter Register
112203B4	AFE_IRQ_MCU_EN	32	AFE IRQ MCU Enable Register
112203B8	AFE_IRQ_MCU_MON2	32	**AFE IRQ MCU MON2 Register** Monitors the command for AFE_IRQ_MCU_CLR register.
112203C0	AFE_IRQ1_MCU_CNT_MON	32	AFE IRQ1 MCU Count Monitor Register
112203C4	AFE_IRQ2_MCU_CNT_MON	32	AFE IRQ2 MCU Count Monitor Register
112203C8	AFE_IRQ1_MCU_EN_CNT_MON	32	**AFE IRQ1 MCU Enable Count Monitor Register** Monitors the enable count number of IRQ1.
112203D4	AFE_MEMIF_MAXLEN	32	**AFE Memif Max BLength Register** Defines the maximum burst length.
112203D8	AFE_MEMIF_PBUF_SIZE	32	**AFE MEMIF Prefecth Buffer Size**

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Address	Name	Width	Register Function
112203DC	AFE_IRQ_MCU_CNT7	32	**AFE IRQ7 MCU Counter Register** Sets up the counter for IRQ1. Note: It is suggested not to set the value of AFE_IRQ1_CNT too short (i.e. 1), or the IRQ period may not be as expected due to MCU IRQ processing delay. Remember to set up the desired AFE_IRQ_MCU_CNT1 before IRQ1 is set. Never set AFE_IRQ1_CNT to 0, or there will be no interrupt for IRQ1 after it is set.
112203F0	AFE_APLL1_TUNER_CFG	32	**AFE Tuner Control Register** Setting for APLL frequency tuner
112203F4	AFE_APLL2_TUNER_CFG	32	**AFE Tuner 2 Control Register** Setting for APLL frequency tuner 2
11220410	AFE_GAIN1_CON0	32	**AFE Gain1 Control Register 0** Defines how many samples per step.
11220414	AFE_GAIN1_CON1	32	**AFE Gain1 Control Register 1** Defines the gain1 target.
11220418	AFE_GAIN1_CON2	32	**AFE Gain1 Control Register 2** Defines the gain1 down step.
1122041C	AFE_GAIN1_CON3	32	**AFE Gain1 Control Register 3** Defines the gain1 up step.
11220420	AFE_GAIN1_CONN	32	**AFE Gain1 Connection Register** Sets up the gain1 interconnection blocks.
11220424	AFE_GAIN1_CUR	32	**AFE Gain1 Cursor Register** Indicates the value current GAIN 1.
11220428	AFE_GAIN2_CON0	32	**AFE Gain2 Control Register 0** Defines how many samples per step.
1122042C	AFE_GAIN2_CON1	32	**AFE Gain2 Control Register 1** Defines the GAIN2 target.
11220430	AFE_GAIN2_CON2	32	**AFE Gain2 Control Register 2** Defines the GAIN2 down step.
11220434	AFE_GAIN2_CON3	32	**AFE Gain2 Control Register 3** Defines the GAIN2 up step.
11220438	AFE_GAIN2_CONN	32	**AFE Gain2 Connection Register** Sets up the GAIN2 interconnection blocks.
1122043C	AFE_GAIN2_CUR	32	**AFE Gain2 Cursor Register** Indicates the value current GAIN 2.
11220440	AFE_GAIN2_CONN2	32	**AFE Gain2 Connection Register 2** Sets up the GAIN2 interconnection blocks.
11220444	AFE_GAIN2_CONN3	32	**AFE Gain2 Connection Register 3** Sets up the GAIN2 interconnection blocks.
11220448	AFE_GAIN1_CONN2	32	**AFE Gain1 Connection Register 2** Sets up the gain1 interconnection blocks.
1122044C	AFE_GAIN1_CONN3	32	**AFE Gain1 Connection Register 3** Sets up the gain1 interconnection blocks.
11220468	AFE_CONN9	32	AFE Connection Register 9

Bit(s)	Name	Description
31	CHSET1_O16BIT	**Selects 16-bit/24-bit output**
29	CHSET1_CLR_IIR_HISTORY	**Set to 1 to clear the current IIR output history buffer for RX** This register will be auto-cleared once the histories are cleared.
28	CHSET1_IS_MONO	**Mono/Stereo selection register**
27:26	CHSET1_OFS_SEL	**Selects output sample rate for RX** Set to 01 for OFS fix value.
25:24	CHSET1_IFS_SEL	**Selects input sample rate for RX** Set to 10 for frequency tracking mode.
23	CHSET1_IIR_EN	**Enables anti-alias IIR filter for RX** Set to 1 to turn on anti-alias IIR filter.
22:20	CHSET1_IIR_STAGE	**Anti-alias IIR filter stage for RX** Defines how many 2-order IIR stages are cascaded for the anti-alias filter. This value should be "real stage amount" minus 1, which means up to 8 stages and 16 orders are supported.
19	CHSET0_O16BIT	**Selects 16-bit/24-bit output**
17	CHSET0_CLR_IIR_HISTORY	**Set to 1 to clear current IIR output history buffer for TX** This register will be auto-cleared once the histories are cleared.
16	CHSET0_IS_MONO	**Mono/Stereo selection register**
15:14	CHSET0_OFS_SEL	**Selects output sample rate for TX** Set to 00 for OFS fix value.

Bit(s)	Name	Description
31:16	FREQ_CALI2_CYCLE	**Frequency calibrating 2 cycle register** Defines how many input signal cycles the calibrator calibrates in one round. This register is updated into calibrator once the calibrator enable [0] is turned on. In OFS 48K or 44.1K, set it to 7.
14	FREQ_CALI2_AUTORST_EN	**Enables freq_cali2 auto reset with the calibrator result that is too large (slow I2S in when FM change)** For I2S in, set it to 1. 0: Disable auto reset 1: Enable auto reset
13	FREQ_CALC2_RUNNING	**Shows if frequency calculation 2 is running.** For one round running case, wait for this bit and the CALI_EN bit to become low before frequency result is ready.
12	AUTO_TUNE_FREQ4	**Enables asm_freq_4 auto update with the calibrator result once the calibrator completes one round** For I2S in, set it to 0. 0: Disable auto update 1: Enable auto update
11	COMP_FREQ_RES_EN2	**Frequency compensation 2 enabling register** 0: Disable compensation 1: Enable compensation
9:8	FREQ_CALI2_SEL	**Selects calibrator 2 input source** Before modifying this register, make sure the calibrator is turned off. For I2S in, set it to 2'b01. 00: Use PCM SYNC word 01: Not connected 10: Not connected 11: Not connected
7	FREQ_CALI2_BP_DGL	**Bypasses deglitch circuit for calibrator 2 input** 0: No bypass 1: Bypass
6:4	FREQ_CALI2_MAX_GWIDTH	**Defines maximum glitch width of calibrator 2 input signal** Unit: Calibrator reference clock cycles
3	AUTO_TUNE_FREQ5	**Enables asm_freq_5 auto update with the calibrator result once the calibrator completes one round** For I2S in, set it to 1. 0: Disable auto update 1: Enable auto update
2	FREQ_CALI2_AUTO	**Enables calibrator 2 auto restart new calibration when one run is**

MEDIATEK CONFIDENTIAL

Bit(s)	Name	Description
31:16	FREQ_CALI_CYCLE	**Frequency calibrating cycle register** Defines how many input signal cycles the calibrator calibrates are in one round. This register is updated into calibrator once the calibrator enable [0] is turned on.
15	FREQ_CALI_AUTORST_EN	**Enables period calibration auto-reset** Period calibration bigger than 0x734 or smaller than 0x738 will trigger ASRC

MEDIATEK CONFIDENTIAL

Bit(s)	Name	Description
		reset.
13	FREQ_CALC_RUNNING	**Shows if frequency calculation is running** For one round running case, wait for this bit and the CALI_EN bit to become low before frequency result is ready.
12	AUTO_TUNE_FREQ3	**Enables asm_freq_3 auto update with the calibrator result once the calibrator completes one round** 0: Disable auto update 1: Enable auto update
11	COMP_FREQ_RES_EN	**Frequency compensation enabling register** 0: Disable compensation 1: Enable compensation
9:8	FREQ_CALI_SEL	**Calibrator input source selection register** Before modifying this register, make sure the calibrator is turned off. 00: Use PCM SYNC word 01: Not connected 10: Not connected 11: Not connected
7	FREQ_CALI_BP_DGL	**Bypasses deglitch circuit for calibrator input** 0: No bypass 1: Bypass
6:4	FREQ_CALI_MAX_GWIDTH	**Defines maximum glitch width of calibrator input signal** Unit: Calibrator reference clock cycles.
3	AUTO_TUNE_FREQ2	**Enables asm_freq_2 auto update with the calibrator result once the calibrator completes one round** 0: Disable auto update 1: Enable auto update
2	FREQ_CALI_AUTO_RESTART	**Enables calibrator auto restart new calibration when one run is completed. This value will be updated into calibrator once the enabling signal is turned on from off state.** 0: Disable auto restart 1: Enable auto restart
1	CALI_USE_FREQ_OUT	**Selects frequency or period calibration mode** 0: Use period calibration result to update asm_freq_2. Use frequency calibration result to update asm_freq_3 1: Use frequency calibration result to update asm_freq_2. Use period calibration result to update asm_freq_3
0	CALI_EN	**Enables frequency calibrator** If auto restart is 0, this bit will be cleared when one calibration run is completed. If this bit is set to 0, wait until this bit to become 0 before making the next run start safely. 0: Disable calibrator 1: Enable calibrator

6 Multimedia Subsystem

6.1 Multimedia Subsystem

6.1.1 Multimedia Subsystem Configuration

6.1.1.1 Introduction

The multimedia subsystem contains multimedia controller, multimedia data path v2.0 (MDP 2.0) and display (DISP). The multimedia controller includes bus fabric control, Smart Memory Interface (SMI) control, memory access second level arbiter, and multimedia configuration. It plays the key role to handle different handshaking between infra subsystem, video subsystem, image subsystem and G3D subsystem. MDP 2.0 is the time sharing pipeline data flow controller to process resizing and rotation by memory access. The display pipeline outputs pixels to display interface with overlay, color enhancement, adaptive ambient light processing, color correction and gamma correction.

6.1.1.2 Features

The multimedia subsystem has the following features:

- APB bus fabric control center
- Smart Multimedia Interface (SMI) controller
- Second level arbiter for memory access request
- Multimedia Data Path v2.0. It has one read DMA, two resizers, one 2D-sharpness enhancement, one write DMA and one write rotator
- Two display pipe lines. One of the pipelines has its own read DMA, overlay, color engine, adaptive ambient light processing, color correction, gamma correction and display interface controller as basic components. The other one only includes read DMA and display interface controller.
- Supports 3D display
- Supports color enhancement engine
- Supports adaptive ambient light processing for backlight power saving and sunlight visibility improvement
- Supports color correction and gamma correction for accurate image reproduction
- Supports concurrent dual display output
- Display output interface: 1 DSI and 1 DPI. DPI interface can connect to external LVDS, HDMI, and MHL bridge chips to support these interfaces.

6.1.1.5 Programming Guide

Before we introduce the programming model, two basic operation modes and one terminology "STREAM" must be explained first to make the programming model reasonable. The basic operation modes are:

1. Single mode:
   In this mode, one SW trigger only makes modules to process one frame. Usually, it is a memory-in-memory-output operation (e.g. memory -> RDMA0 -> PRZ0 -> WDMA0 -> memory), or an operation output to the display device with frame buffer (e.g. memory -> RDMA0-> color0-> gamma -> DSI0. SW must wait for one frame processing to be done before triggering the next frame.

2. Refresh mode:
   In this mode, pixels must be outputted to the display device without frame buffer (e.g. DSI video mode and DPI). After a data path is configured as refresh mode and starts, it will process frame-by-frame automatically until the data path stops. The process follows the refresh timing (vsync, hsync and data enable) of the display output interface.

In the refresh mode, the display output interface refresh timing is asynchronous to software, and we must guarantee each module receives complete settings for one frame when it starts to process this frame. For this reason, a mutex between software and hardware is used to achieve this.

A mutex is used to specify a STREAM and to guarantee a complete setting of this STREAM is seen by modules in this STREAM.

- A STREAM means a data stream from Source to Sink.
- Source can be any module with read memory capability, which is RDMA or OVL.
- Sink can be any module with capability of outputting to external display devices or to memory, which is DSI0, DPI or WDMA/WROT.

In multimedia subsys, there are at most 8 STREAMs concurrently. Therefore, we provide 10 mutexes. Every mutex's function and register interface are the same.

Mutex has the following attributes, which can be set in dispsys_mutex.

- Source of SOF (Start Of Frame)
  It means the Sink of this STREAM is which module. Due to the display timing of a STREAM, when to start a frame/when to end a frame, is decided by the Sink, and the display subsys must know it to route the SOF signal to all modules in this mutex.
- Which modules are in the STREAM.

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL

Because one mutex describes one STREAM, there is a constraint that one module can be set in only one mutex. In other words, one module cannot be set in more than one mutex.

6.2 SMI_COMMON

6.2.1 Introduction

SMI (Smart Multimedia Interface) is a simple bus protocol for multimedia engines to access system memories, including off-chip and on-chip memories. As in the block diagram, multimedia engines access EMI and MM memory through the SMI bus. The MM memory is part of SMI controller and designed to have short accessing latency and high bandwidth for multimedia engines. From the perspective of SMI, the multimedia engines are masters of the bus, and SMI itself is the slave of the bus. Furthermore, the MM memory is regarded as internal memory and EMI which is a type of external memory.

In this document, we will focus on SMI_COMMON.

6.2.2 Features

- Auto clock gating for power reduction
- Arbitration among request from local arbiters to EMI
- Bandwidth/outstanding limiter
- Performance monitor
- Command throttling for reducing latency

6.2.4 Register Definition

Module name: SMI_COMMON_EXT Base address: (+14016000h)

Address	Name	Width	Register Function
14016100	SMI_L1LEN	32	**SMI Level 1 ARB Setting** Sets up Level 1 bandwidth filter length.
14016104	SMI_L1ARB0	32	**SMI Level 1 BW Filter Control M0** Controls master 0 bandwidth filter.
14016108	SMI_L1ARB1	32	**SMI Level 1 BW Filter Control M1** Controls master 1 bandwidth filter.
1401610C	SMI_L1ARB2	32	**SMI Level 1 BW Filter Control M2** Controls master 2 bandwidth filter.
14016110	SMI_L1ARB3	32	**SMI Level 1 BW Filter Control M2** Controls master 2 bandwidth filter.
140161A0	SMI_MON_AXI_ENA	32	**SMI AXI Performance Monitor Enable** Enables AXI performance monitor.
140161A4	SMI_MON_AXI_CLR	32	**SMI AXI Performance Monitor Clear** Clears AXI performance monitor.
140161AC	SMI_MON_AXI_TYPE	32	**SMI AXI Monitor Type Selection Register** Selects performance monitor type.
140161B0	SMI_MON_AXI_CON	32	**SMI AXI Performance Monitor Control Register** Controls performance monitor.
140161C0	SMI_MON_AXI_ACT_CNT	32	**SMI AXI Monitor Active Counter Register** Counts active cycles for monitor.
140161C4	SMI_MON_AXI_REQ_CNT	32	**SMI AXI Monitor Request Counter Register** Counts request cycles for monitor.
140161C8	SMI_MON_AXI_OSTD_CNT	32	**SMI AXI Monitor OSTD Counter Register** Counts idle cycles for monitor.
140161CC	SMI_MON_AXI_BEA_CNT	32	**SMI AXI Monitor Beat Counter Register** Counts beats for monitor.
140161D0	SMI_MON_AXI_BYT_CNT	32	**SMI AXI Monitor Byte Counter Register** Counts bytes for monitor.
140161D4	SMI_MON_AXI_CP_CNT	32	**SMI AXI Monitor Command Phase Counter Register** Counts command phase cycles for monitor.
140161D8	SMI_MON_AXI_DP_CNT	32	**SMI AXI Monitor Data Phase Counter Register** Counts data phase cycles for monitor.
140161DC	SMI_MON_AXI_CP_MAX	32	**SMI AXI Monitor Command Phase Maximum Register** Counts command/data phase maximum cycles for monitor.
140161E0	SMI_MON_AXI_COS_MAX	32	**SMI AXI Monitor Outstanding Transaction Maximum Register** Counts outstanding transaction's maximum cycles for monitor.
14016228	SMI_WRR_REG0	32	**SMI WRR Credit CTRL0** WRR credit control 0
14016230	SMI_READ_FIFO_TH	32	**ARB Mode** Controls command throttling
14016234	SMI_M4U_TH	32	**CH OUTS Limiter EN**
1401623C	SMI_PREULTRA_MASK0	32	**SMI Preultra Mask Setting 0** Sets up preultra mask.
14016240	SMI_PREULTRA_MASK1	32	**SMI Preultra Mask Setting 1** Sets up preultra mask.
14016300	SMI_DCM	32	**SMI DCM Control** Controls SMI DCM.

6.3 SMI_LARB

6.3.1 Introduction

The SMI (Smart Multimedia Interface) is a MediaTek proprietary interface used in multimedia systems. The SMI bus fabric deals with the complex bus interconnection and memory access transaction in a high-performance multimedia-rich system. The SMI bus fabric is separated into 2 parts for hierarchical arbitration. The SMI local arbiter is used for the first level arbitration for part of multimedia engines. The granted masters from SMI local arbiters are arbitrated at the second level arbiter at SMI common arbiter with other masters in other multimedia sub-systems.

6.3.2 Features

- 1st level arbitration of multimedia engines
- GMC/SMI protocol to AXI protocol conversion
- Supports bandwidth regulation for each master
- Performance monitor enables performance index measurement

6.3.3 Block Diagram

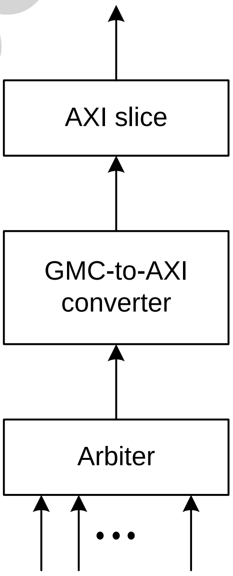

Figure 6-4. SMI local arbiter block diagram

6.3.4 Register Definition

The base addresses of local arbiters are listed below.

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Table 6-1. Base addresses of SMI local arbiters

Module	Base address
SMI_LARB0	0x1401_5000
SMI_LARB1	0x1601_0000
SMI_LARB2	0x1500_1000
SMI_LARB3	0x1700_1000

The following register table is for SMI_LARB0. Replace the base address 0x14016000 with the base address of other SMI local arbiters when you are to program other SMI local arbiters.

Module name: SMI_LARB0 Base address: (+14015000h)

Address	Name	Width	Register Function
14015000	SMI_LARB_STAT	32	**SMI Local Arbiter Status Register** SMI local arbiter global status register
14015004	SMI_LARB_IRQ_EN	32	**SMI Local Arbiter IRQ Enable Register** Controls SMI local arbiter interrupt enabling settings.
14015008	SMI_LARB_IRQ_STATUS	32	**SMI Local Arbiter IRQ Status Register** Reports SMI local arbiter interrupt status.
1401500C	SMI_LARB_SLP_CON	32	**SMI Local Arbiter Sleep Control Register** Controls SMI local arbiter sleep procedure.
14015010	SMI_LARB_CON	32	**SMI Local Arbiter Control Status Register** SMI local arbiter control status register
14015014	SMI_LARB_CON_SET	32	**SMI Local Arbiter Control Set Register** SMI local arbiter control set register
14015018	SMI_LARB_CON_CLR	32	**SMI Local Arbiter Control Clear Register** SMI local arbiter control clear register
14015020	SMI_LARB_VC_PRI_MODE	32	**SMI Local Arbiter VC Priority Mode Register** Controls VC priority settings.
14015024	SMI_LARB_CMD_THRT_CON	32	**SMI Local Arbiter Command Throttling Control Register** Controls command throttling settings.
14015028	SMI_LARB_STARV_CON	32	**SMI Local Arbiter Starvation Control Register** Controls starvation control settings.
1401502C	SMI_LARB_EMI_CON	32	**SMI Local Arbiter EMI Control Register** Controls EMI feedback status.
14015030	SMI_LARB_SHARE_EN	32	**SMI Local Arbiter Sharable Bit Enable Register** Controls port 0~31 coherence settings.
14015050	SMI_LARB_BWL_EN	32	**SMI Local Arbiter Bandwidth Limiter Enable Register** Controls port 0~31 bandwidth limiter enabling.
14015054	SMI_LARB_BWL_SOFT_EN	32	**SMI Local Arbiter Bandwidth Limiter Soft Mode Enable Register** Controls port 0~31 bandwidth limiter soft mode enabling.
14015058	SMI_LARB_BWL_CON	32	**SMI Local Arbiter Bandwidth Limiter Control Register** Controls bandwidth limiters' overshoot bandwidth level.
14015060	SMI_LARB_OSTDL_EN	32	**SMI Local Arbiter Outstanding Limiter Enable Register** Controls port 0~31 outstanding limiter enabling.
14015064	SMI_LARB_OSTDL_SOFT_EN	32	**SMI Local Arbiter Outstanding Limiter Soft Mode Enable Register**

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.

Address	Name	Width	Register Function
			Controls port 0~31 outstanding limiter soft mode enabling.
14015070	SMI_LARB_ULTRA_DIS	32	**SMI Local Arbiter Ultra-high Sideband Disable Register** Forces disabling of port 0~31 ultra high sideband.
14015074	SMI_LARB_PREULTRA_DIS	32	**SMI Local Arbiter Pre-ultra-high Sideband Disable Register** Forces disabling of port 0~31 pre-ultra high sideband.
14015078	SMI_LARB_FORCE_ULTRA	32	**SMI Local Arbiter Force Enable Ultra-high Sideband Register** Forces enabling of port 0~31 ultra high sideband.
1401507C	SMI_LARB_FORCE_PREULTRA	32	**SMI Local Arbiter Force Enable Pre-ultra-high Sideband Register** Forces enabling of port 0~31 pre-ultra high sideband.
14015080	SMI_LARB_MST_GRP_SEL_L	32	**SMI Local Arbiter Master Group Selection Low Register** Sets up port 0~15 group ID.
14015084	SMI_LARB_MST_GRP_SEL_H	32	**SMI Local Arbiter Master Group Selection High Register** Sets up port 16~31 group ID.
14015090	SMI_LARB_INT_PATH_SEL	32	**SMI Local Arbiter Internal SRAM Access Path Selection Register** Controls the SMI local arbiter's internal SRAM path.
14015094	SMI_LARB_CMD_DET_CON	32	**SMI Local Arbiter Specific Command Detection Control Register** Controls the command detection function.
14015098	SMI_LARB_SPEC_CMD_DET	32	**SMI Local Arbiter Specific Command Detection Status Register** Records the occurrence of specific command.
1401509C	SMI_LARB_CRS4K_CMD_DET	32	**SMI Local Arbiter Cross-4KB Command Detection Status Register** Records the occurrence of cross 4K command.
140150A0	SMI_LARB_EXT_GREQ_VIO	32	**SMI Local Arbiter External Access Request Violation Status Register** Records the occurrence of external memory request address violation.
140150A4	SMI_LARB_INT_GREQ_VIO	32	**SMI Local Arbiter Internal Access Request Violation Status Register** Records the occurrence of internal memory request address violation.
140150A8	SMI_LARB_OSTD_UDF_VIO	32	**SMI Local Arbiter Outstanding Counter Underflow Violation Status Register** Records the occurrence of outstanding counter underflow.
140150AC	SMI_LARB_OSTD_CRS_VIO	32	**SMI Local Arbiter Cross-outstanding Access Violation Status Register** Records the occurrence of cross outstanding access of internal and external memory.
140150B0	SMI_LARB_FIFO_STAT	32	**SMI Local Arbiter FIFO Status Register** Shows SMI local arbiter's FIFO status.
140150B4	SMI_LARB_BUS_STAT	32	**SMI Local Arbiter AXI Bus Status Register** Shows SMI local arbiter's AXI bus status.
140150B8	SMI_LARB_CMD_THRT_STAT	32	**SMI Local Arbiter Command Throttling Status Register** Reports command throttling status.
140150BC	SMI_LARB_MON_REQ	32	**SMI Local Arbiter Primary Input Request Monitor Register** Monitors request of master 0~31.

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Address	Name	Width	Register Function
140150C0	SMI_LARB_REQ_MASK	32	**SMI Local Arbiter Primary Input Masked Request Monitor Register** Monitors request mask of master 0~31.
140150C4	SMI_LARB_REQ_DET	32	**SMI Local Arbiter Request Type Detection Monitor Register** Monitors occurrence of request type of master 0~31.
140150C8	SMI_LARB_EXT_ONGOING	32	**SMI Local Arbiter On-going External Memory Access Monitor Register** Monitors if the external memory access of a master is active.
140150CC	SMI_LARB_INT_ONGOING	32	**SMI Local Arbiter On-going Internal Memory Access Monitor Register** Monitors if the internal memory access of a master is active.
140150D0	SMI_LARB_MISC_MON0	32	**SMI Local Arbiter Miscellaneous Monitor Register** Monitors sleep protection related signals.
140150D8	SMI_LARB_ARB_MON0	32	**SMI Local Arbiter Arbitration Monitor Register 0** Monitors arbiter related signals.
140150DC	SMI_LARB_ARB_MON1	32	**SMI Local Arbiter Arbitration Monitor Register 1** Monitors arbiter related signals.
140150F0	SMI_LARB_DBG_CON	32	**SMI Local Arbiter Debug Control Register** Sets up SMI local arbiter's debugging features.
140150F4	SMI_LARB_TST_MODE	32	**SMI Local Arbiter Test Mode Control Register** Sets up SMI local arbiter's test modes.
14015100 ~ 1401517C	SMI_LARB_WRR_PORT[n] (n=0~31)	32	**SMI Local Arbiter Master Port Weighting Value Register** Controls external access port weighted round-robin credit.
14015180 ~ 140151FC	SMI_LARB_BWL_PORT[n] (n=0~31)	32	**SMI Local Arbiter Master Port Bandwidth Value Register** Controls each master's bandwidth limit value.
14015200 ~ 1401527C	SMI_LARB_OSTDL_PORT[n] (n=0~31)	32	**SMI Local Arbiter Master Port Outstanding Value Register** Controls outstanding limiter of memory access.
14015280 ~ 140152FC	SMI_LARB_OSTD_MON_PORT[n] (n=0~31)	32	**SMI Local Arbiter Master Port Outstanding Count Monitor Register** Monitors outstanding counter.
14015300 ~ 1401537C	SMI_LARB_PINFO[n] (n=0~31)	32	**SMI Local Arbiter Master Port Information Register** Reports port spec.
14015400	SMI_LARB_MON_EN	32	**SMI Local Arbiter Performance Monitor Enable Register** Enables performance monitor.
14015404	SMI_LARB_MON_CLR	32	**SMI Local Arbiter Performance Monitor Result Clear Register** Clears performance monitor.
14015408	SMI_LARB_MON_PORT	32	**SMI Local Arbiter Performance Monitor Port Selection Register** Selects one port to monitor its performance.
1401540C	SMI_LARB_MON_CON	32	**SMI Local Arbiter Performance Monitor Control Register** Controls performance monitor.
14015410	SMI_LARB_MON_ACT_CNT	32	**SMI Local Arbiter Active Count Performance Monitor Register** Counts active cycles for monitor.
14015414	SMI_LARB_MON_REQ_CNT	32	**SMI Local Arbiter Request Count Performance Monitor Register** Counts request cycles for monitor.

MEDIATEK CONFIDENTIAL

6.4 CAM

6.4.1 Introduction

Camera receives RAW and SOC sensor image data after processing of images and outputting YUV data to DRAM.

6.4.2 Features

The camera incorporates a feature-rich image signal processor to connect with a variety of image sensor components. This processor consists of timing generated unit (TG), lens/sensor compensation unit and image process unit.

- Interface
  - Main cam: MIPI 4 lane, 1.5Gbps/lane/parallel interface
  - Sub cam: MIPI 4 lane1.5Gbps/lane /parallel interface
- Raw dump frame rate is 13M@30fps
- Supports video snapshot, which enables user capture image while recording video
- Image processing
  - Bad pix compensation
  - Lens shading compensation
  - Demosaic
  - Color clipping
  - Gamma correction
  - Edge enhancement
  - Noise reduction with large kernel
  - Temporal noise reduction
  - Multi frame blending for lowlight condition
  - Preference color adaptation
- 3A statistics and correction
- Flicker detection
- Electronic image stabilization for video
- Video face beautifier
- Image face Beautifier
- Supports picture in picture/video in video
- High quality resizers

Bit(s)	Name	Description
		in Native 3D case; only works when CQ0B_CONT=0.
5	CQ0_START	**CQ0 start** It has two modes. See CQ0_mode field in CTL_SEL module. Only works when CQ0_CONT=0.
4	PASS2C_START	**Pass2C module start signal** Used for all sceanrio and concurrence modes. In this case, the command queue must be eanbled and load CQ3 data 2. In TPIPE processing scenario, if TPIPE interrupt setting on TPIPE cofiguration map is 1, it will need to trigger pass2_start again after TPIPE_int is issued.
1	PASS2B_START	**Pass2B module start signal** Used for all sceanrio and concurrence modes. In this case, the command queue must eanbled and load CQ2 data. In TPIPE processing scenario, if TPIPE interrupt setting on TPIPE cofiguration map is 1, it will need to trigger pass2_start again after TPIPE_int is issued.
0	PASS2_START	**Pass2 module start signal** Used for all sceanrios. If CQ_en =1, it will load CQ1 data first. In TPIPE processing scenario, if TPIPE interrupt setting on TPIPE cofiguration map is 1, it will need to trigger pass2_start again after TPIPE_int is issued.

Bit(s)	Name	Description
		Enables NR3D
14	LCE_EN	**Dobule buffer** Enables LCEr
13	SEEE_EN	**Double buffer** Enables SEEE
12	PCA_EN	**Double buffer** Enables PCA
11	NBC_EN	**Double buffer** Enables NBC
10	C42_EN	**Double buffer** Enables YUV 444 to 422
9	G2C_EN	**Double buffer** Enables GB to YUV, including negative and sephia function.
8	C24_EN	**Double buffer** Enables YUV 422 to 444. The double buffer load time depends on scenario. If the module is at pass1, load time will be RG frame start. If the module is at pass2, load time will be pass2_start.
7	MFB_EN	**Enables MFB** DPI, VEI, BPI, PDI DMA and PDO DMA should also be enabled. Double buffer
6	GGM_EN	**Double buffer** Enables RGB Gamma
5	G2G_EN	**Double buffer** Enables 3x3 matrix
4	CCL_EN	**Double buffer** Enables CCL
3	CFA_EN	**Double buffer** Enables demosaic. HF compensation uses the same enable.
2	SL2_EN	**Double buffer** Enables SL2
1	PGN_EN	**Double buffer** Enables pregain
0	UFD_EN	**Double buffer** Enables UFD

1500401C **CAM_CTL_EN_P2_DMA** **ISP DMA Enable** **00000000**

Bit(s)	Name	Description
11	FEO_EN	**Double buffer** Enables FE output DMA
10	IMG3CO_EN	**Double buffer** Enables 3DNR output IMG3CO, V plane
9	IMG3BO_EN	**Double buffer** Enables 3DNR output IMG3BO, U plane or UV plane
8	IMG3O_EN	**Double buffer** Enables 3DNR output IMG3Om Y plane or YUYV plane
7	IMG2O_EN	**Double buffer**
6	MFBO_EN	**Dobule buffer** Enables MFB weighting table output DMA
5	LCEI_EN	**Double buffer** Enables LCE input DMA
4	VIP3I_EN	**Double buffer** Enables VIP3I. For MFB 422 1p or N3D C02 v plane input.
3	VIP2I_EN	**Double buffer** Enables VIP2I DMA. For MFB weighting, 422 1p input or N3D c02 U plane or UV plane input.
2	VIPI_EN	**Double buffer** Enables MFB 2nd 422 1 plane DMA
1	UFDI_EN	**Double buffer** Enables UFO input DMA
0	IMGI_EN	**Double buffer** Enables IMGI. Can be UNO , UFD, C24, CCL, MFB and NR3D input. Depends on scenario. In CC scenario: UNP for bayer input UFD for UFO input CCL for RGB input C24 for YUV422 input MFB for MFB scenario NR3D for NCC scneario CQ1/2/3 also shares with IMGI DMA.

Bit(s)	Name	Description
20	W2G_MODE_D	**SRAM mux W2G mode (dual raw)**
19	LSC_EARLY_SOF_EN_D	**Enables LSC early SOF (dual raw)** 0: Normal case 1: Enable early LSC early SOF. It affects LSCI and LSC SOF/db_load. The priority is higher than LSCI_SOF_SEL_EN.
18	PREGAIN_SEL_EN_D	**Enables PREGAIN_SEL (dual raw)**
17	PREGAIN_SEL_D	**PREGAIN_SEL (dual raw)** Only works when PREGGAIN_SEL_EN=1. 0: From RRZ (CC) 1: From IMGI (IP)
16	BIN_SEL_EN_D	**Enables BIN_SEL (dual raw)**
15	BIN_SEL_D	**BIN_SEL (dual raw)** Only works when BIN_SEL_EN=1. 0: From TG (CC) 1: From DMA (IP)
14	INT_MRG	**Merges interrupt**
11	W2G_MODE	**SRAM mux W2G mode**
10	LSC_EARLY_SOF_EN	**Enables LSC early SOF** 0: Normal case 1: Enable early LSC early SOF. It affects LSCI and LSC SOF/db_load. The priority is higher than LSCI_SOF_SEL_EN.
9	PREGAIN_SEL_EN	**Enables PREGAIN_SEL**
8	PREGAIN_SEL	**PREGAIN_SEL** Only works when PREGGAIN_SEL_EN=1. 0: From RRZ (CC) 1: From IMGI (IP)
7	BIN_SEL_EN	**Enables BIN_SEL**
6	BIN_SEL	**BIN_SEL** Only works when BIN_SEL_EN=1. 0: From TG (CC) 1: From DMA (IP)
5	DUAL_MODE	0: Disable dual raw 1: Enable dual raw
3	APB_CLK_GATE_BYPASS	**Bypasses APB clock gating** 1: Always turn on APB clock
1	PASS1_D_DB_EN	**Enables Pass1 _D module double buffer**
0	PASS1_DB_EN	**Enables Pass1 module double buffer**

15004048 **CAM_CTL_INT_P1_EN** **ISP Interrupt Enable** **00000000**

Bit(s)	Name	Description
6	HW_RST_P2	**Pass2** 0: No HW reset 1: Async HW reset. Reset all CAM modules, except for register setting module.
5	SW_RST_P2_ST	**Pass2** Software reset status 0: DMA is busy. 1: DMA is idle; can do HW reset.
4	SW_RST_P2_Trig	**Pass2** Triggers software reset. Write 1 to trigger.
2	HW_RST	**Pass1** 0: No HW reset 1: Async HW reset. Reset all CAM modules, except for register setting module.
1	SW_RST_ST	**Pass1** Software reset status 0: DMA is busy. 1: DMA is idle; can do HW reset.
0	SW_RST_Trig	**Pass1** Triggers software reset. Write 1 to trigger.

Bit(s)	Name	Description
12	PXL_CNT_RST_SRC	**Pixel counter reset source** 0: Vsync rising edge (default) 1: Vsync falling edge
11:10	EOF_SRC	**End of frame source** 0: Line count reaches LIN_END. Pixel count reaches PXL_END (only this case). 1: Vsync rising edge 2: Vsync falling edge 3: pixel_cnt reaches EOT_CNT.
9:8	SOF_SRC	**Start of frame source** 0: Vsync rising edge 1: Vsync falling edge 2: pixel_cnt reaches SOF_CNT.
3	SOT_CLR_MODE	**SOT RGB/YUV mode** 0: Choose SOT_MODE selection 1: SOT position before data 1T. Only for RGB, YUV and JPG (default case)
2	SOT_MODE	**SOT mode** 0: SOT position is at SOT_CNT. 1: SOT position is sof_1d (fixed to this).
1	DBL_DATA_BUS	**Doubles asynchronous FIFO data bus** For YUV422, RGB565 or JPEG mode, this bit can be set to 1'b1. For RAW/RGB888 mode, this bit must be 1'b0.
0	CMOS_EN	**Enables CMOS**

	MODE		_MODE								_TABLE_END_MODE	_LUT_EN				_EN
Type	RW		RW								RW	RW				RW
Reset	1	0	0	0							1	0				0

Bit(s)	Name	Description
17:16	BPC_CRC_MODE	**Double buffer** Anisotropic interpolation, ranking filter or both Valid value: 0 ~ 2 0: Automatic detect 1: Anisotropic filter only 2: Ranking filter only
15:14	BPC_CS_MODE	**Double buffer** Enables cluster handling solution mode for BPC cluster correction 0: Support up to size 2 1: Support up to size 4 (aggressive) 2: Support up to size 4 (conservative)
13:12	BPC_DTC_MODE	**Double buffer** OTF, table lookup or both. Should be '0' if BPC table is off. 0: Use OTF only to locate bad pixels; any one of 3 cases is held. Case A: Table lookup only (if table exists) Case B: OTF detected and strong bad pixel (BP_level>STRONG_BP_THR_LA) Case C: Very strong bad pixel (BP_level>STRONG_BP_THR_LB) 1: Bad pixels detected by OTF also locate in the table. 2: Use table only to locate bad pixels (This mode can handle >=3 clusters.)
5	BPC_TABLE_END_MODE	**Double buffer** Wait table input path finished (FKBPI eot) or not. 0: Does not wait for table finished. FKBPI is forced to be restarted by SOF. This mode can only be used when FKBPI configurations are not changed. 1: Wait table finished
4	BPC_LUT_EN	**Double buffer** Enables table lookup If 1, BPC_DTC_MODE = 0.
0	BPC_EN	**Double buffer** Enables 2D BPC correction

Reset				0		0	1	0			0	0			0	0

Bit(s)	Name	Description
24	ANR_LCE_LINK	**Double buffer** Enables link with LCE
19:16	ANR_Y_LUMA_SCALE	**Double buffer** Different in TPIPE mode and frame mode. TPIPE mode = (IC || N3D_IC || TDR_EN) TPIPE mode: The blending ratio between input and 7x7 lowpass filtered output. The blending result is for luma LUT. Valid range: 0 ~ 8. 0 is the un-filter image, and 8 is the 7x7 lowpas filter output. Frame mode: 0: Use input to calculate the difference 1: Use the 3x3 or 3x2 low pass filter on center pixel to calculate the difference in range filter. It reduces jaggy edges with a little reduced sharpness.
12	ANR_MODE	**Double buffer** Reserved. For using verification cmodel, it should be programmed correctly as "!(IC||N3D_IC||TDR_EN)".
10:8	ANR_FLT_MODE	**Double buffer** Different in TPIPE mode and frame mode. TPIPE mode = (IC || N3D_IC || TDR_EN) In frame mode: 0: No IIR 1: 2 lines of IIR 2: 3 lines of IIR 3: 3 lines of IIR 4: 4 lines of IIR 5: 4 lines of IIR In TPIPE mode: 0: No IIR
5:4	ANR_SCALE_MODE	**Double buffer** Different in TPIPE mode and frame mode. TPIPE mode = (IC || N3D_IC || TDR_EN) For TPIPE mode: 0: Use 19x19 kernel in luma channel and chroma 1: Use 19x19 and 39x39 kernel in luma and chroma channel respectively 2: Use 39x39 kernel in both luma and chroma channel (subsampled by 2) For frame mode: 0: Use single pixel as the luma LUT input Not 0: Use the 3x3 lowpass filter output as luma LUT input
1	ANR_ENY	**Double buffer** Enables Y ANR
0	ANR_ENC	**Double buffer** Enables C ANR

Reset	1	0	0	0							1	0				0

Bit(s)	Name	Description
17:16	BPC_CRC_MODE	**Double buffer** Anisotropic interpolation or ranking filter or both Valid value: 0~2 0: Automatic detect. 1: Anisotropic filter only 2. Ranking filter only
15:14	BPC_CS_MODE	**Double buffer** Enables cluster handling solution mode for BPC cluster correction 0: Support up to size 2 1: Support up to size 4 (aggressive) 2: Support up to size 4 (conservative)
13:12	BPC_DTC_MODE	**Double buffer** OTF or table lookup or both. Should be 0 if BPC table is off. 0: Use OTF only to locate bad pixels, any of the 3 cases hold Case 1) Table lookup only (if table exists) Case 2) OTF detected and strong bad pixel (BP_level>STRONG_BP_THR_LA) Case 3) Very strong bad pixel (BP_level>STRONG_BP_THR_LB) 1: Bad pixels detected by OTF also locate in the table 2: Use table only to locate bad pixels (This mode can handle >=3 clusters.)
5	BPC_TABLE_END_MODE	**Double buffer** Waits for table input path finished (FKBPI eot) or not 0: Does not wait for table finished. FKBPI is forced to restart by SOF. This mode can only be used when FKBPI configurations are not changed. 1: Wait for table finished
4	BPC_LUT_EN	**Double buffer.** Enables table lookup 1: BPC_DTC_MODE = 0
0	BPC_EN	**Double buffer** Enables 2D BPC correction

6.5 SENINF_TOP (Sensor Interface)

6.5.1 Introduction

The seninf_top module transfers sensor signal into image pixels and pass them to ISP.

6.5.2 Features

- MIPI interface
  - Two 4-lanes MIPI interfaces
  - Virtual channel/Data type data interleaving
- Serial interface
  - 1 Serial interface
- Parallel interface
  - 1 parallel interface
- Provides 3 sensor master clocks

6.5.3 Register Definition

Module name: seninf_top Base address: (+15008000h)

Bit(s)	Mnemonic	Name	Description
	MASK		0: All warnings will be recorded. 1: Warnings before the first frame start packet will not be recorded, i.e. no interrupt and no warning counter increasing.
25:24	**CSD_NUM**	CSD_NUM	**Number of CSD channels** 0: 1 data channel 1: 2 data channels 2: 4 data channels
20	**DBG_MD**	Debug_mode	**Enables debug mode** 0: Normal mode 1: Debug mode. CSD is not parsed or decoded, and raw data are transferred to CAMINF.
17	**CONT**	Continuous_mode	**Enables continuous mode** 0: Single run 1: Continuous run
12	**CLK_INV**	Clock_inverse	**Inverse latch for clock from sensor**
10:8	**CYC**	Cycle	**Cycle counts for rising of serial interface pixel clock after data are valid.**
6	**INTEN6**	INTEN6	**Enables interrupt of wrong size**
5	**INTEN5**	INTEN5	**Enables interrupt of wrong data ID**
4	**INTEN4**	INTEN4	**Enables interrupt of wrong line ID**
3	**INTEN3**	INTEN3	**Enables interrupt of wrong packet ID**
2	**INTEN2**	INTEN2	**Enables interrupt of wrong sync header**
1	**INTEN1**	INTEN1	**Enables interrupt of CRC error**
0	**INTEN0**	INTEN0	**Enables interrupt of frame end**

15008224 SCAM1_CON SCAM1 Control Register 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name																RST
Type																RW
Reset																0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																ENA
Type																RW
Reset																0

Bit(s)	Mnemonic	Name	Description
16	**RST**	Reset	**Write 1 to stop SCAM immediately and keep in reset state.** Write 0 to enter the normal state. The software reset will not reset all register settings.
0	**ENA**	Enable	**Write 1 to start the SCAM.** Trigger SCAM before triggering the image sensor and clear RST before setting ENA = 1.

15008228 SCAM1_INT SCAM1 Interrupt Register 00000000

Bit(s)	Name	Description
7	ERR_MULTI_LANE_SYNC	Asserted when multiple lane synchronization fails
6	ERR_AFIFO	Asserted when error occurs in asynchronous FIFO
5	ERR_CRC	Asserted when the computed CRC code is different from the received CRC code
4	ERR_ECC_DOUBLE	Asserted when an ECC syndrome is computed and two bit-errors are detected in the received packet header
3	ERR_ECC_CORRECTED	Asserted when an ECC syndrome is computed and a single bit-error in the packet header is detected and corrected
2	ERR_ECC_NO_ERROR	**Asserted when an ECC syndrome is computed and the result is 0 indicating a packet header that is considered to be without errors or has more than two bit errors** CSI-2's ECC mechanism cannot detect this type of error.
1	ERR_ID	Asserted when a packet header is decoded with an unrecognized or unimplemented data ID
0	ERR_FRAME_SYNC	Asserted when a Frame End is not paired with a Frame Start on the same virtual channel

12	FS	Frame start interrupt
11	ERR_SOT_SYNC_HS_LNRD3	Asserted when proper synchronization cannot be expected
10	ERR_SOT_SYNC_HS_LNRD2	Asserted when proper synchronization cannot be expected
9	ERR_SOT_SYNC_HS_LNRD1	Asserted when proper synchronization cannot be expected
8	ERR_SOT_SYNC_HS_LNRD0	Asserted when proper synchronization cannot be expected
7	ERR_MULTI_LANE_SYNC	Asserted when multiple lane synchronization fails
6	ERR_AFIFO	Asserted when error occurs in asynchronous FIFO
5	ERR_CRC	Asserted when the computed CRC code is different from the received CRC code
4	ERR_ECC_DOUBLE	Asserted when an ECC syndrome is computed and two bit-errors are detected in the received packet header
3	ERR_ECC_CORRECTED	Asserted when an ECC syndrome is computed and a single bit-error in the packet header is detected and corrected
2	ERR_ECC_NO_ERROR	**Asserted when an ECC syndrome is computed and the result is 0 indicating a packet header that is considered to be without errors or has more than two bit errors** CSI-2's ECC mechanism cannot detect this type of error.
1	ERR_ID	Asserted when a packet header is decoded with an unrecognized or unimplemented data ID
0	ERR_FRAME_SYNC	Asserted when a Frame End is not paired with a Frame Start on the same virtual channel

6.6 FDVT

6.6.1 Module Introduction

6.6.1.1 Overview

Face Detection and Visual Tracking (FDVT) Engine is used to detect new coming faces and track the existing faces in an image. It has the capability of detecting the faces of Rotation-in-Plane (RIP) from -180° to +180° and Rotation-off-Plane (ROP) from -90° to +90° (see Figure 6-5).

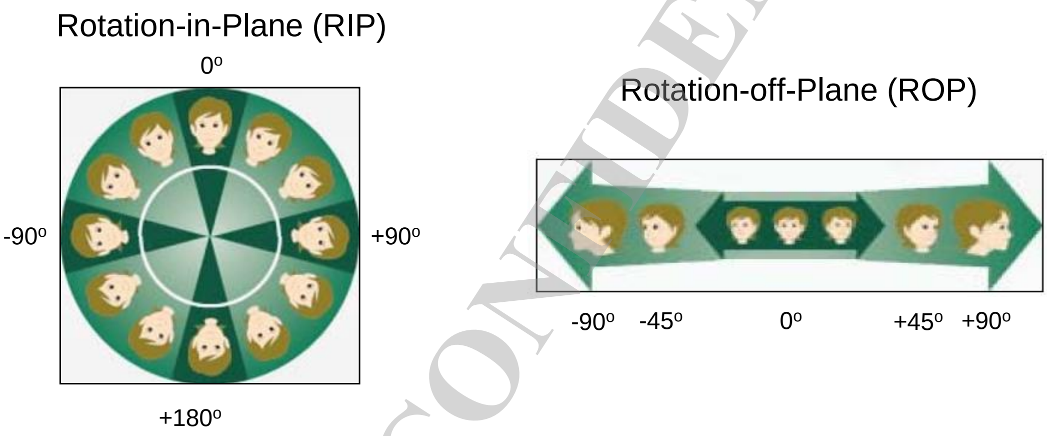

Figure 6-5. Definition of RIP and ROP

The input image of FDVT is the RGB565/YUV420/YUV422 data in the external memory, which is generated by ISP module. FDVT supports images of size up to 1022x1022 pixels. The FDVT outputs are the locations, sizes, estimated pose and confidence values of the detected faces, which are also stored in the external memory.

6.6.1.2 Theory of Operations

FDVT detects the faces in an image with the unit called Macro-window. The Macro-window scans the positions within the image. In each position, FDVT uses the predetermined features to determine if the Macro-window contains the face or not. In order to detect the large faces by using the Macro-window of the same size, FDVT rescales the original gray image into the smaller ones and does the scanning process in the re-scaled images. Figure 6-6Figure 6-6 illustrates the concept of Macro-window detection.

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

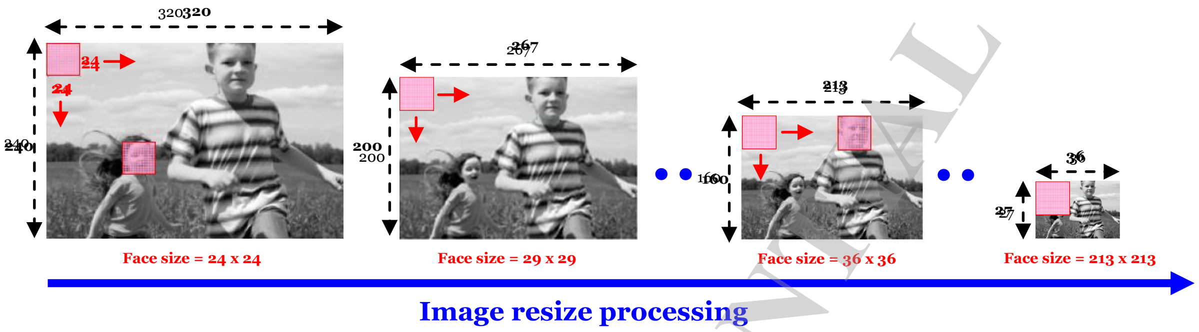

Figure 6-6. Example of face detection with 24x24 Macro-window

In the Macro-window of each position in the image, FDVT calculates the feature values and confidence values to determine if it contains the face. To increase the speed of calculating the values, FDVT uses the concept of integral image, which is generated by IIG module. If the face is detected in the Macro-window, FDVT will write the position, size, estimated pose and confidence value of the face to the external memory via DMA. Once all the re-scaled images are scanned completely, FDVT will send the interrupt signal to notify the firmware to read the face detection. Then, FDVT can prepare to do the detection in the next image. Figure 6-7Figure 6-7 shows the FDVT operation flow mentioned above. Details on the operations are described in the next section.

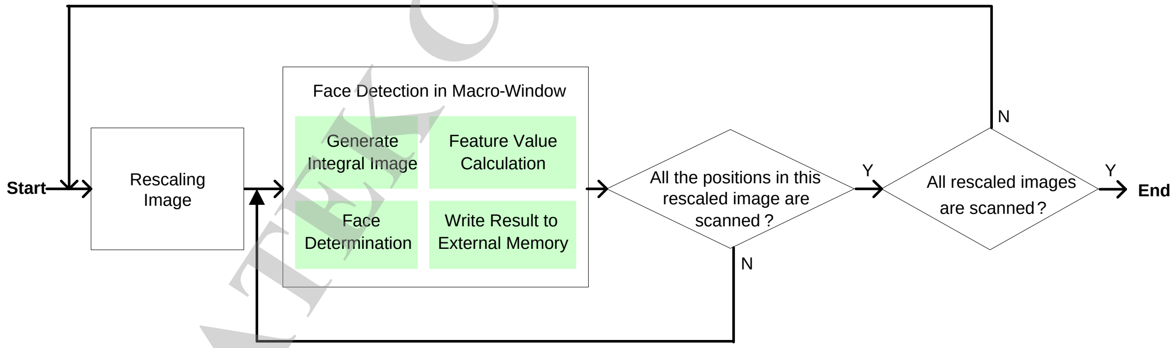

Figure 6-7. FDE operation flow

6.6.2 Software Control Flow and Register Settings

6.6.2.1 Software Control Introduction

Initially SW must initialize all registers (blue part). After that, not all the registers must be updated (only the red part needs to be updated frame by frame) (see Figure 6-8).

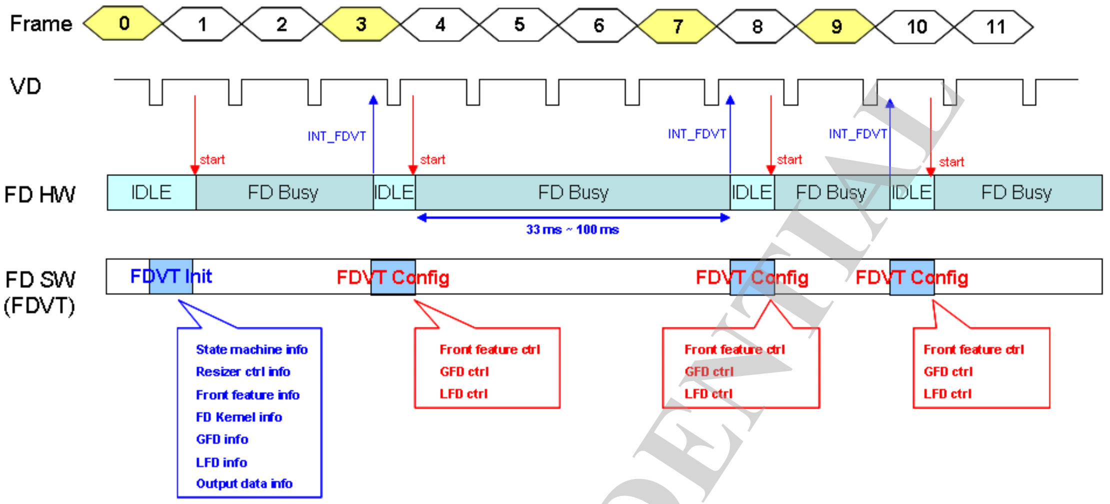

Figure 6-8. Register setting timing diagram

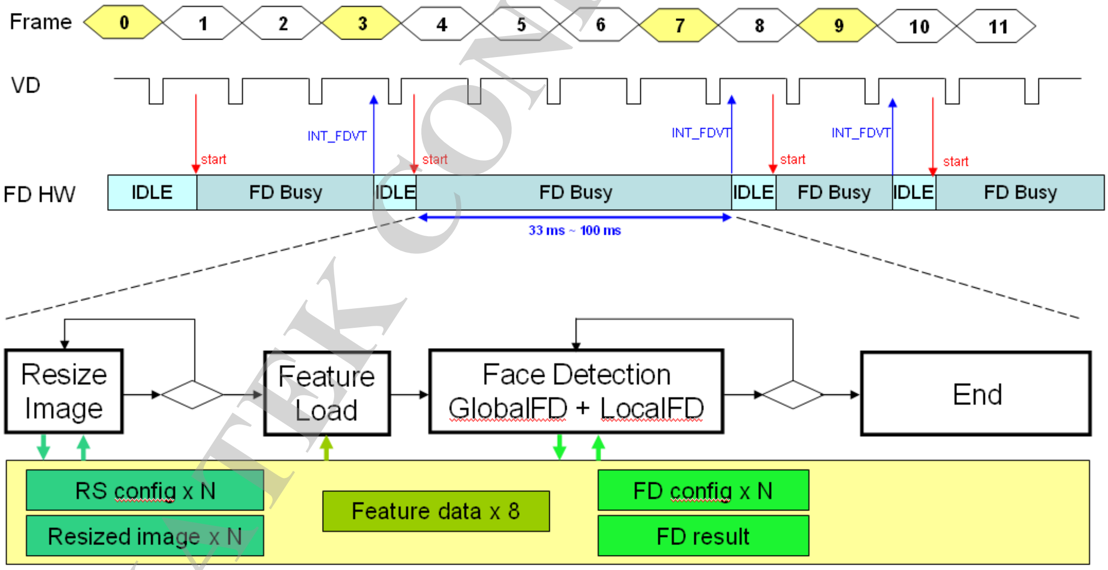

Figure 6-9. Hardware FDVT processing flow in one frame

First the resizer resizes the input image to several smaller images you need. RS_config (RS configuration) contains the resize information of each small image. If you have N small image, set up N RS_config. Hardware will read these configurations and store the corresponding smaller images to DRAM.

Next, HW loads all the front-end features from DRAM to SRAM. SW must set the front-end feature number of each data set (total 8 data sets).

The face detection part will start processing after the front-end feature load is finished. HW will load FD_config (FD configuration) to do GFD (Global Face Detection) and LFD (Local Face Detection)

process. FD_config contains the face detection information of each small image. If you have N small image, set up N FD_config. Hardware will read these configurations to do further processing. If any face candidate is found, HW will store the face result (information) to DRAM.

Module name: FDVT Base address: (+1500B000h)

Address	Name	Width	Register Function

Bit(s)	Name	Description
17	DMA_STOP	**It is recommended to use DMA_STOP before HARD_RST.** When this bit is set to 1, FDVT engine will start to terminate GMC access FDVT engine will clear this bit to 0 automatically when GMC access is completed. The recommended DMA stop flow is setting DMA_STOP to 1 then polling DMA_STOP until it is set to 0.
16	HARD_RST	**Hard reset** Set this bit to 1 to reset FDVT engine immediately. Set this bit to 0 to return to normal mode. GMC access may not be completed immediately when this bit is set to 1. It is safer to wait for a period of time after setting this bit to 1 before setting this bit to 0.
0	START	**FDVT start signal** Set to 1 to start FDVT hardware engine.

Note: Base address should be 16-byte aligned.

IMG_BASE_ADR Base address of the source (luma only) image

IMG_WD Width of source image

IMG_HT Height of source image

ROP_ENABLE_SEMI Enables ROP50 and ROP-50 LFD detection
- **0** pose 12 ~ pose 35 will not be detected by LFD.
- **1** pose 12 ~ pose 35 will be detected by LFD if LFD_POSE is set to detect this pose.

ROP_ENABLE_FULL Enables ROP90 and ROP-90 LFD detection
- **0** pose 36 ~ pose 59 will not be detected by LFD.
- **1** pose 36 ~ pose 59 will be detected by LFD if LFD_POSE is set to detect this pose.

SFACTOR Scaling factor relative to RGB image size. Format is 6.9 (>=1.0)

IFACTOR Inverse scaling factor relative to RGB image size. Format is 1.9 (<=1.0)

SHIFT_H Horizontal search range of active window. LFD searches from (LFDXX.x0-SHIFT_H) to (LFDXX.x0+SHIFT_H).The unit is one pixel of RGB image size.

SHIFT_V Vertical search range of active window. LFD searches from (LFDXX.y0-SHIFT_V) to (LFDXX.y0+SHIFT_V).The unit is one pixel of RGB image size.

IMG_STRIDE Stride of source image

	1	Face is detected by LFD.
X0, Y0, X1, Y1	Indicates face candidate position	
FCV	Indicates face confidence value of the face candidate	
RIP_DIR	Indicates face RIP (rotate in plane) direction	
	0	0°
	1	30°
	2	60°
	...	
	11	-30°
	Others	Reserved
ROP_DIR	Indicates face ROP (rotate out of plane) direction	
	0	0°
	1	50°
	2	-50°
	3	90°
	4	-90°
	Others	Reserved
DET_SIZE	Indicates face size index

6.7 MDP_RDMA

6.7.1 Introduction

MDP RDMA is used to read images of multiple source format in memory and then output in scan-line sequence to the following engine. It supports several functions, such as

- Input image clipping, as illustrated in Figure 6-10.
- Different input formats, as listed in Table 6-2.
- Color conversion for RGB to YUV.
- Chroma upsample for cosited or non-consited YUV422/420 source

To support larger image size with cost burden, tile mode scheme is applied in MDP. MDP_RDMA is fully tile mode ready and can fulfill the single or tile mode operation. It also has a 3x3 color conversion inside. When the input is in RGB domain and output is in YCbCr domain, the 3x3 color conversion should be set well to get the correct data.

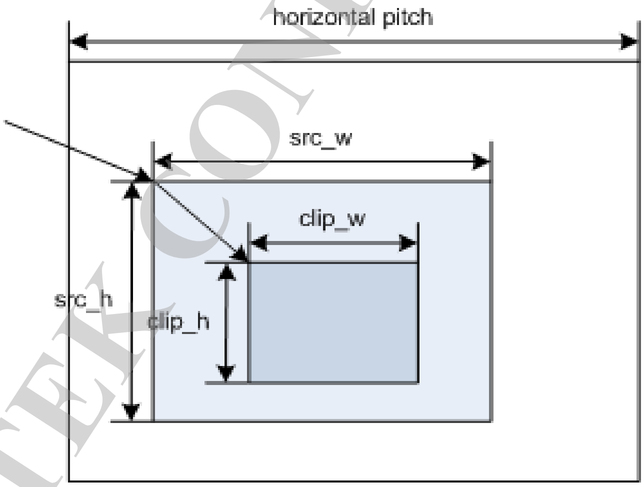

Figure 6-10. Support clipping from source frame buffer

Table 6-2. Input format list

Input domain	Supported format
YCbCr	YCbCr_420_P_SW YCbCr_420_SP_SW YCbCr_420_SP_HW_BLOCK YCbCr_420_SP_HW_BLOCK_INTERLACE YCbCr_422_P_SW YCbCr_422_SP_SW YCbCr_422_I_SW YCbCr_422_I_HW_BLOCK Y Only
RGB	RGB565 RGB(BGR)888

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL

Input domain	Supported format
	ARGB(RGBA)8888 XRGB(RGBX)8888

6.7.2 Features

- Supports multiple format of input images
- Supports up to Full HD resolution 1920x1200@60 fps without tile mode
- Supports YUV420/422 scanline 1/2/3 planes and RGB 16/24/32 bits
- Supports arbitrary byte swap for YUV or RGB source
- Supports cropping/clipping.
- Supports chroma up-sample filter to YUV444
- Supports default optimized or programmable RGB2YUV
- Tile mode ready; supports source width up to 131072 pixels
- Direct link to RSZ with YUV 444

6.7.3 Block Diagram

The internal pipeline of MDP_RDMA is shown in the following diagram, the input is from external memory via SMI read port, and output is direct linked to the next engine depending on the dispsys data-path setting, e.g. RSZ. There is also APB interface for S/W control, following the mutex protocol for advanced S/W control from disp_mutex.

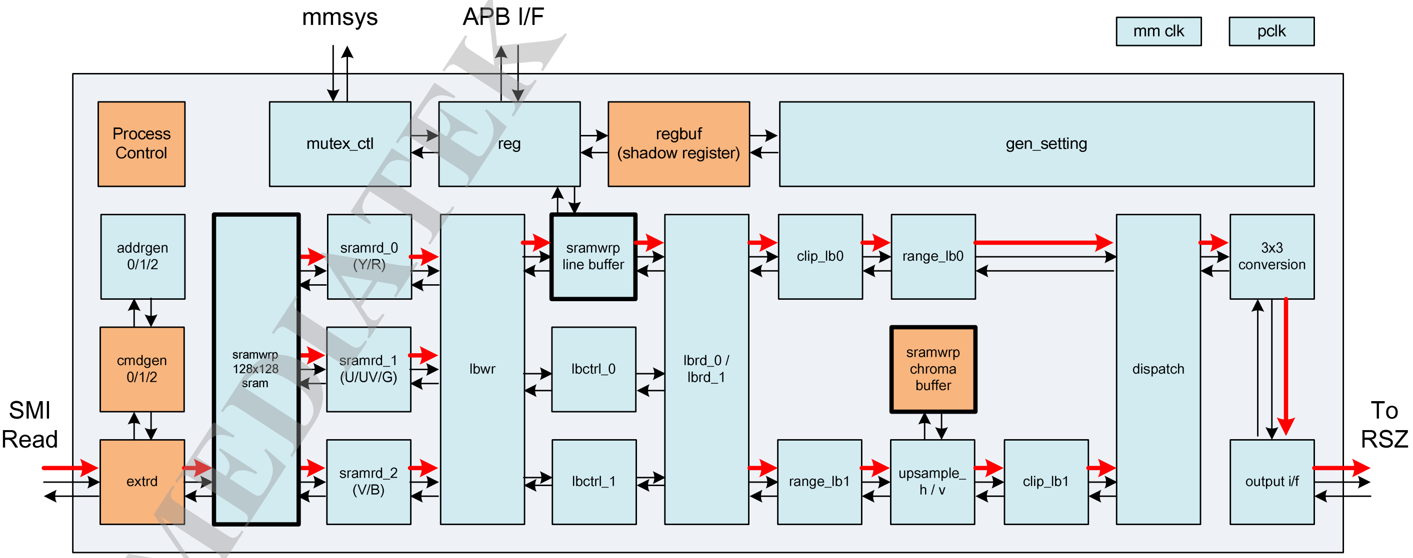

Figure 6-11. Block diagram of DISP MDP_RDMA

6.7.5 Programming Guide

To enable MDP_RDMA to read a frame, SW can be programmed by the following method. Here we offer a quick example: With an YCbCr_420_P_SW 1920x1080 frame provided in DRAM, MDP_RDMA will try to clip it into 256x256 as the following example settings:

1. Release reset and enable all interrupt
   DISP_ROT_RESET = 0x0000_0000
   DISP_ROT_INTERRUPT_ENABLE = 0x0000_0007
2. Set up controls to determine the behavior of MDP_RDMA.
   DISP_ROT_CON = 0x0000_0000
3. Set up SMI configuration for performance issues.
   DISP_ROT_GMCIF_CON = 0x0000_1771
4. Set up input format.
   DISP_ROT_SRC_CON = 0x0000_0000
5. Set up base address 0 for the first plane of the source frame. If the source frame contains more than one plane, base address 1 and base address 2 should be set as well. Note that the offset of start address is relative to operations. Refer to appendix for the start address offset cases.
   DISP_ROT_SRC_BASE_0 = 0x0007_7880
   DISP_ROT_SRC_BASE_1 = 0x0080_6c40
   DISP_ROT_SRC_BASE_2 = 0x00A0_1040
6. Calculate the byte number of the line pitch. It is the distance from the first byte of the current line to the first byte of the next line. The value for sub frame is required for multiple planar source.
   DISP_ROT_MF_BKGD_SIZE_IN_BYTE = 0x0000_0780
   DISP_ROT_SF_BKGD_SIZE_IN_BYTE = 0x0000_0780
7. Set up the width and the height of the source frame before it is rotated.
   DISP_ROT_MF_SRC_SIZE = 0x0100_0100
8. Set up the clip size if necessary.
   DISP_ROT_MF_CLIP_SIZE = 0x0100_0100
9. Set up offset in source format if necessary.
   DISP_ROT_MF_OFFSET_1 = 0x0000_0000
10. Set up option for RGB to YUV color transform control registers and parameters if necessary.
    DISP_ROT_TRANSFORM_0 = 0x0000_0000
11. Assert ROTEN to enable MDP_RDMA to wait for update of the shadow register.
    DISP_ROT_EN = 0x0000_0001
12. Assert register update to start operation of MDP_RDMA. This control signal comes from dispsys mutex control.

6.8 MDP RSZ

6.8.1 Introduction

There are two resizer modules for MT6735 MDP, including MDP_RSZ0 and MDP_RSZ1. The algorithm of each may be slightly different for different project requirements. The table lists the corresponding algorithm spec. Table 6-3 shows the functional specification of MDP_RSZ0 and MDP_RSZ1. MDP_RSZ0 and MDP_RSZ1 scale for multiple purposes in MDP 2.0 structure, mainly for generating image for display, video codec, jpeg codec and FD. Digital zoom is accomplished by MDP_RSZ0 or MDP_RSZ1 in MDP 2.0. MDP_RSZ0 and MDP_RSZ1 supports YUV444 input and YUV444 output.

Table 6-4 shows the hardware specifications of MDP_RSZ0 and MDP_RSZ1. They support three scaling algorithms including 6-tap FIR, 4n-tap cubic accumulation and n-tap source accumulation. The maximum image width is 544.

Table 6-3. Functional specifications of resizers

	MDP_RSZ0	MDP_RSZ1

6.8.2 Theory of Operations

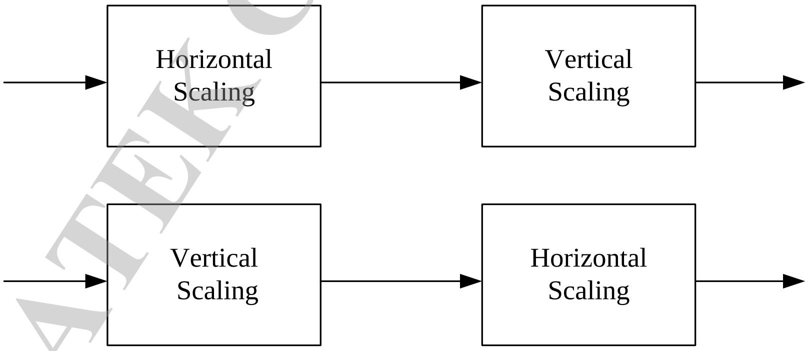

Figure 6-14. Separate 1D FIR operaiton

Basically, the rescaling procedure is composed of two separate 1D FIR operations (see Figure 6-14). There are three major types of 1D FIR operation, 6 tap FIR, 4n tap cubic accumulation and n tap source accumulation. These three algorithms have different rescaling characters and tap numbers. 6 tap is suitable for up-scaling and down-scaling (1X~1/2X). It is a fixed 6 tap FIR operation and needs 18-line buffer to do vertical scaling operation (see Figure 6-15).

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

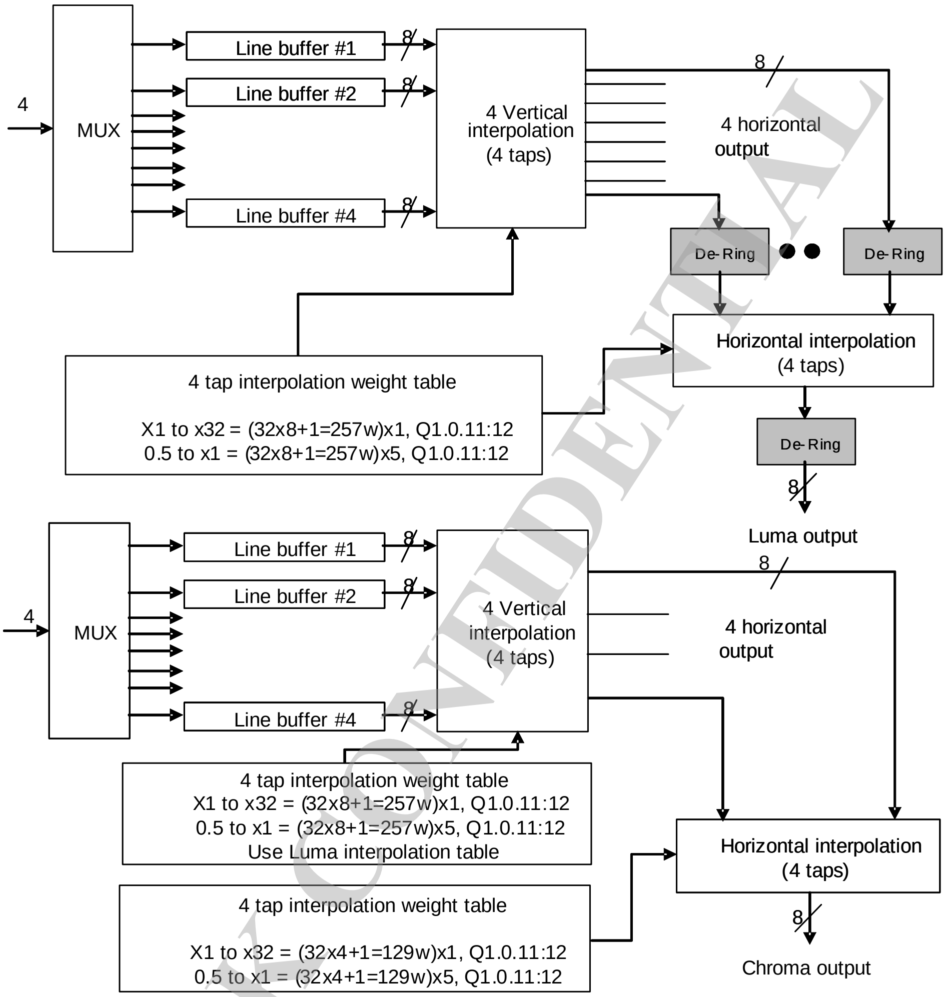

Figure 6-15. 4 tap cubic block diagram (Luma and Chroma data, in MT6735 4tap changes to 6tap)

4n tap cubic accumulation has better quality than 6 tap FIR when the down-scaling ratio is bigger than 1/2X. It is essential a variable tap FIR operation and its tap number is determined by scaling ratio (4 times n, n is scaling ratio). For example, when the scaling ratio is 1, the tap number is 4 (see Figure 6-16). When the scaling ratio is 1/2, the tap number is 8 (see Figure 6-17). In addition, n tap source accumulation is also a variable tap number FIR algorithm. It has poor sharpness and is an extremely low cost solution.

6.8.3 Programming Guide

6.8.3.1 Suggested Algorithm

Corresponding to applied scaling ratio, here is the suggested algorithm for the resizer to choose from. The algorithm is suggested for the best quality. The principles are:

- 6tap: 32x ~ 1/2x
- 4ntap: 1/2x ~ 1/64x
- ntap: 1x ~ 1/128x

However, the suggested algorithm may contradict with limited supporting size in each resizer engine. Take CDRZ for example, as described in the figure below, if a certain application needs to use CDRZ to resize from 3000 to 1400, it is suggested to use 4ntap cubic accumulation algorithm. However, the supported size of 4ntap in CDRZ is 1152, which is smaller than 1400. Therefore, in this case choose ntap to be applied.

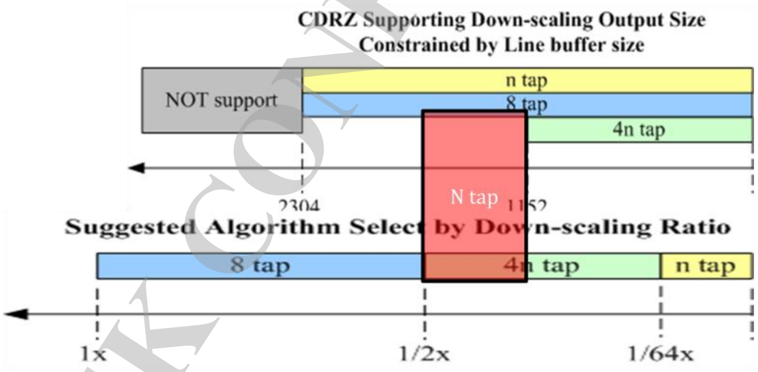

Figure 6-18. Suggested algorithm v.s. supported size

6.8.3.2 Coefficient Step Calculation

The coefficient step is calculated in different way for different algorithms. Refer to the descriptions below.

- 6tap:
  - Unit base: 32768 (2^15)
  - M_m1 = Input_size **– In_Int_Ofst – (In_Sub_Ofst==0? 0 : 1)** -1
  - N_m1 = Output_size -1
  - Cstep = (M_m1*UNIT+(N_m1>>1))/N_m1
- 6tap:
  - Unit base: **65536** (2^16) (note the offset settings)
- 4ntap:
  - Unit base: 1048576 (2^20)
  - M_m1 = Input_size **– In_Int_Ofst – (In_Sub_Ofst==0? 0 : 1)** -1
  - N_m1 = Output_size -1

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL

  - Cstep = (N_m1*UNIT+(M_m1-1))/M_m1
  - Transfer offset from input to output
- N-tap:
  - Unit base: 1048576 (2^20)
  - M_m1 = Input_size **– In_Int_Ofst – (In_Sub_Ofst==0? 0 : 1)** -1
  - N_m1 = Output_size -1
  - Cstep = (N_m1*UNIT+(M_m1-1))/M_m1
  - Transfer offset from input to output

6.8.3.3 Input/Output Offset Transfer

- For 6 tap interpolation, set "Input Offset" into register.
  - Set register Int_Ofst = In_Int_Ofst ;
  - Set register Sub_Ofst = In_Sub_Ofst ;
- For Accumulation, set "Output Offset" into register.
  - Transfer Input Offset to Output Offset
  - Out_Int_Ofst = (In_Int_Ofst*Cstep + In_Sub_Ofst*Cstep/Unit)/Unit
  - Out_Sub_Ofst = (In_Int_Ofst*Cstep + In_Sub_Ofst*Cstep/Unit) % Unit

6.8.3.4 Table Selection

- 6tap/6tap: Depends on scaling ratio
  - [1~32768]: Table 27 or Table 0~19
  - (32768:36409): Table 20
  - [36409:40961): Table 21
  - [40961:46812): Table 22
  - [46812:54614): Table 23
  - [46812:59579): Table 24
  - [59579:65537): Table 25
  - [65537~∞): Table 26
- 4n tap (downscaling only)
  - 1~19 (blur ~ sharp), 15 is recommended
- N tap (downscaling only): No table selection required

The entire programming guide is as the following steps:
- Decide input/output size.
- Check "Maximum Size" constraint.
- Calculate the ratio.
- Choose algorithm from "Suggested Algorithm".
- Check "Supporting Size" constraint.
- Trigger Resizer and wait for IRQ.

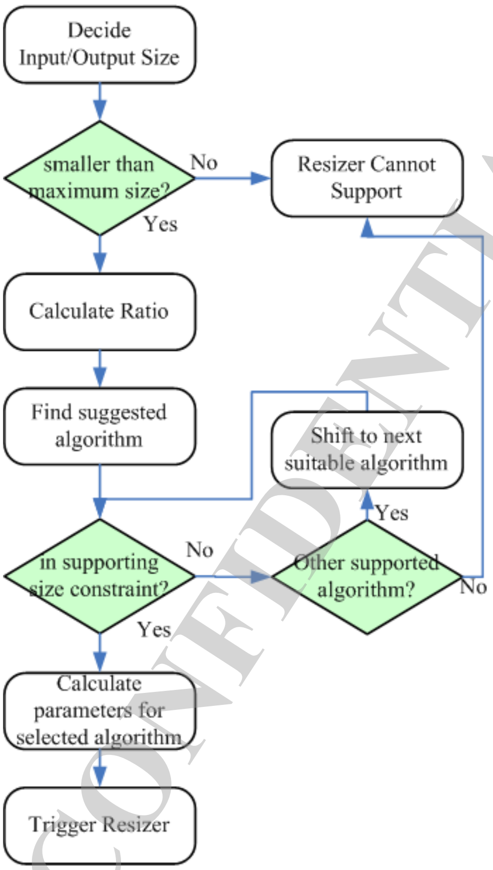

Figure 6-19. Programming guide

6.8.3.5 Programming Method

In MT6735, there are two programming methods

- CPU program through APB bus
- Command queue

Please use proper programming method for different applications. In the video recording application, program CDRZ and MDP_RSZ0/MDP_RSZ1 by command queue to synchronize frame level setting between ISP and MDP processing.

6.8.4 Register Definition

Module name: MDP_RSZ Base address: (+14002000h)

Address	Name	Width	Register Function
14002000	MDP_RSZ_RSZ_ENABLE	32	**RSZ Enable AND Reset** RSZ enable register
14002004	MDP_RSZ_RSZ_CONTROL	32	**RSZ Control** RSZ control register
14002008	MDP_RSZ_RSZ_	32	**RSZ Interrupt Flag**

6.9 MDP ROT_DMA (Multimedia Data Path-Rotation DMA)

6.9.1 Introduction

ROT_DMA is a write rotate DMA agent supporting 8 rotation/flip options for users holding the phone in any orientation to rotate the image in the correct direction.

6.9.2 Features

- Rotation Angels: 0°, 0° + H_Flip, 90°, 90° + H_Flip, 180°, 180° + H_Flip, 270°, and 270° + H_Flip as illustrated in **Error! Reference source not found.**.
- Format and Footprint: YUV422 1/2/3 plane, YUV420 2/3 plane, RGB888, ARGB8888, RGB565, Y only
- Programmable RGB color matrix
- Dither engine

6.9.3 Block Diagram

See the figure below for the engine architecture, including color matrix, dither, sub-sampling, rotator and DMA engines.

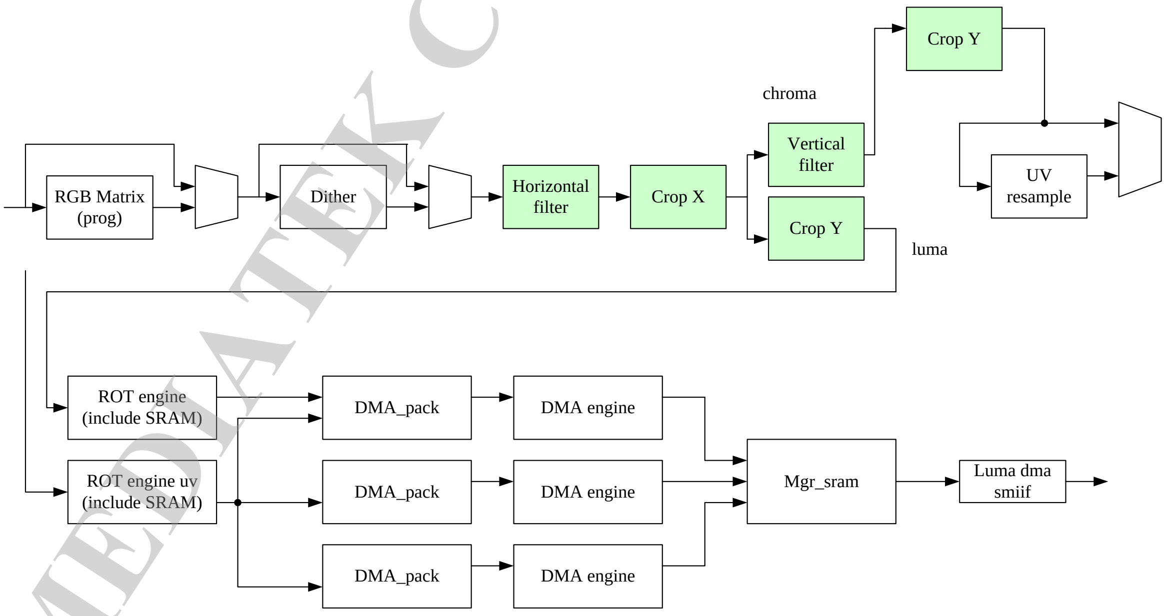

Figure 6-20. Block diagram of ROT_DMA

6.9.5 Programming Guide

6.9.5.1 Firmware Settings for Rotation/Flip

To output data to DRAM with rotation/flip, ROT_DMA should calculate the correct address to put the first data. Then the next data can be written in certain order which also depends on rotation/flip settings. However, the circuit for calculating the address to put the first data is only applied in the beginning of the entire image or tile. For cost effectiveness, the address offset for the first data compared to BASE_ADDR can be calculated by firmware and transferred into hardware by register OFST_ADDR. For all kinds of rotation/flip settings, the required positions of OFST_ADDR are different. The illustrations for the position of OFST_ADDR on DRAM footprint is shown in Figure 6-21 to Figure 6-24. Note that the xsize and ysize are defined according to input data scan-line direction. The direction of xsize is parallel to input scan-line direction, and the direction of ysize is perpendicular to input scan-line direction. The stride setting is defined according to DRAM footprint, which is the direction after rotation/flip.

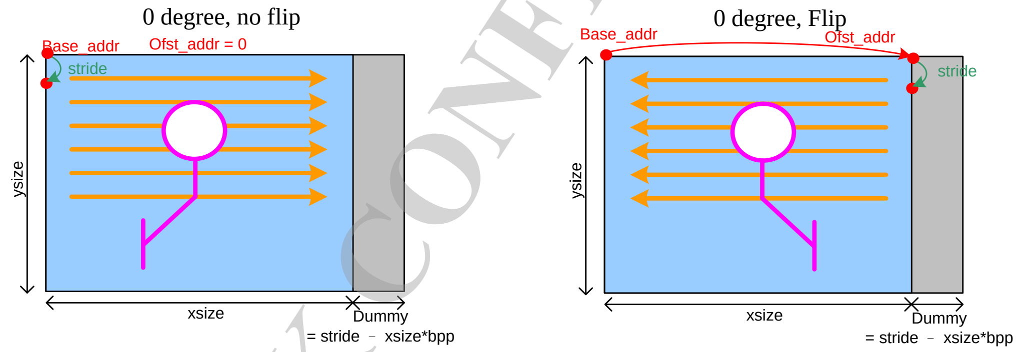

Figure 6-21. Firmware settings of OFST_ADDR in 0° rotation (scan-line)

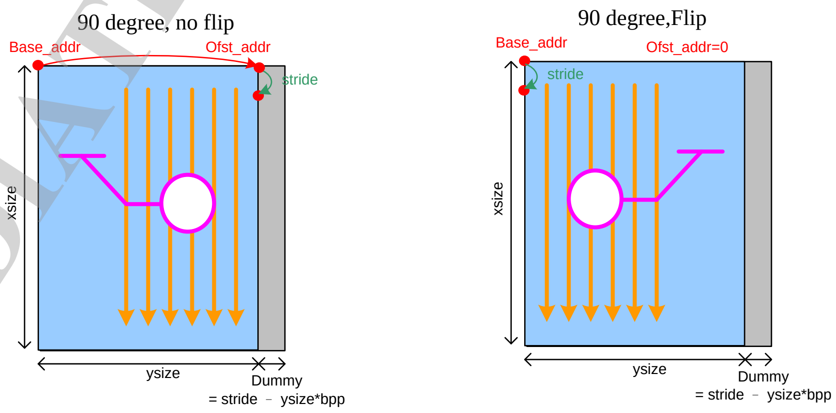

Figure 6-22. Firmware settings of OFST_ADDR in 90° rotation (scan-line)

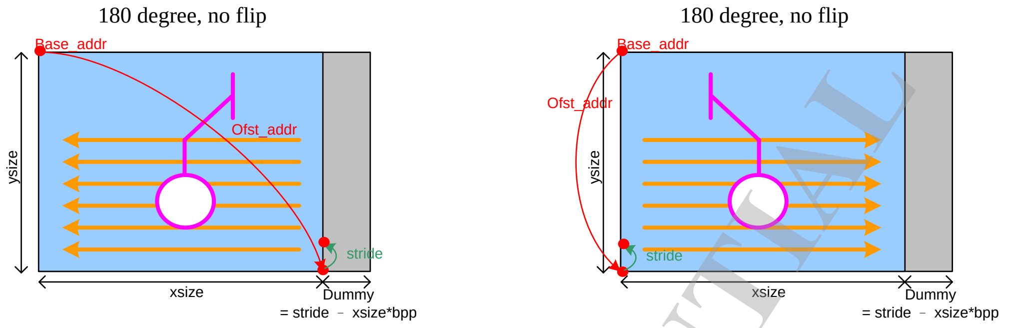

Figure 6-23. Firmware settings of OFST_ADDR in 180° rotation (scan-line)

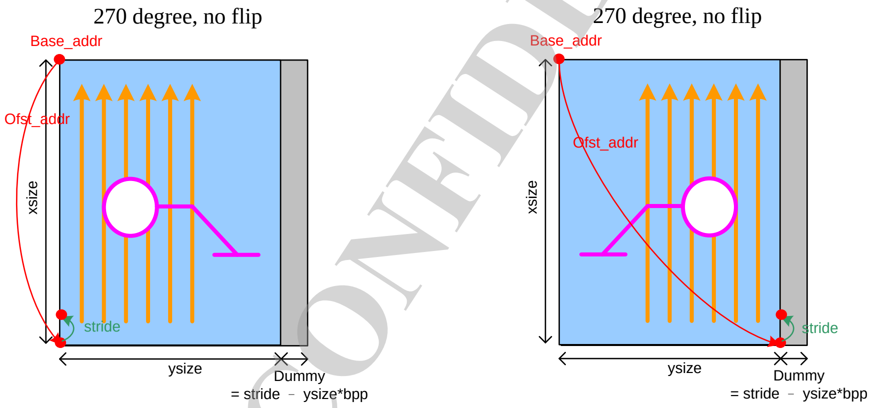

Figure 6-24. Firmware settings of OFST_ADDR in 270° rotation (scan-line)

Summary is given in Table 6-5.

Table 6-5. ROT_DMA OFST_ADDR settings for rotation/flip

Rotation	No Flip (Flip = 0)	Horizontal Flip (Flip = 1)
0 degree (Rotation=0)	0	Xsize-1
90 degree (Rotation=1)	Ysize-1	0
180 degree (Rotation=2)	Stride*(Ysize-1) +(Xsize-1)	Stride*(Ysize-1)
270 degree (Rotation=3)	Stride*(xsize-1)	Stride*(Xsize-1) +(Ysize-1)

For an interpolation based UV-resampler, which can perform better quality for YUV420, VIDO UVSEL should be set corresponding to different rotation/flip settings. According to Table 6-6, the suggested settings provide the proper chroma sampled points.

Rotation	Flip	UV_SELX	UV_SELY
0	0	0	1
0	1	1	1
1	0	0	0
1	1	0	0
2	0	1	1
2	1	0	1
3	0	0	1
3	1	0	1

6.9.5.2 Working Buffer Height Setting

Setting up the buffer width and buffer height for ROT_DMA is necessary, no matter the rotation is enabled or not. Set N mod M = 0 for better performance. If N mod M is not 0, and you would like the efficiency to drop as little as possible, derive an algorithm for height calculation.

First of all, you need to know the buffer size for each format.

```
if (UYVY 2-plane or 3-plane)
     y_max_buf_size = 256x48
    uv_max_buf_size = 128x48
else if (YUV420)
     y_max_buf_size = 256x64
    uv_max_buf_size = 128x32
else
     y_max_buf_size = 256x32
    uv_max_buf_size = 256x32
```

Algorithm: (Width is tile width.)

Phase 1:

We can apply the algorithm on Y channel first to get the approximation first.

Coeff 1= floor (MAX_BUF_SIZE / WIDTH/2) *2
Coeff 2= Ceiling (WIDTH / Coeff1)
Buf_line_num= Ceiling (WIDTH/Coeff 2/ 4) *4 (To make sure if Buf_line_num mod 4 = 0)

If (buf_line_num > width)
Buf_line_num = ceiling (width / 4) * 4 (To make sure width >= Buf_line_num)

else if (Buf_line_num * Buf_line_num * Coeff 2 > MAX_BUF_SIZE) (buffer overflow)
Buf_line_num = buf_height.

Phase 2:

Check if the setting is over the buffer size or not.

6.9.5.3 SMI 256 Byte Boundary Restriction

6.9.5.3.1 Methods to Handle Boundary Restriction

SMI has a restriction that any burst issued from DMA cannot cross the 256-byte address boundary, no matter in read or write action. The reason is from the bank configuration in SMI, where the 256-byte address is only the bank switching point.

Here we try to analyze the probability of crossing the 256-byte boundary by random access. As illustrated in Figure 6-25. The probability P is

P = (byte per burst length)/256

It depends on the designed burst length of ROT_DMA. For example, if the minimum burst length 4-16, the probability P = 64/256 = ¼, which means that 25% burst request will be separated. Though the total data amount is fixed, it increases 25% burst request times and will reduce DRAM access utility.

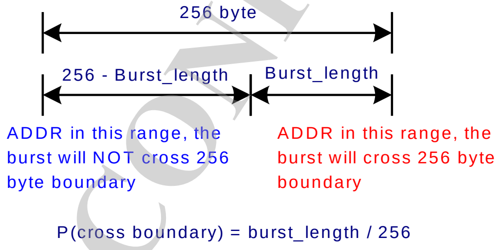

Figure 6-25. Probability of crossing 256-byte boundary by random access

To handle this restriction from SMI, there are two common solutions. One is adopting a burst separator between ROT_DMA and SMI port. As illustrated in Figure 6-26, the original DMA requests are represented in black arrow. Because it is not considered 256 byte boundary restriction, some requests should be cross the 256-byte boundary. The burst separator filters all requests from ROT_DMA, which allows the legal request pass as represented in blue arrows but separate the illegal request into two requests as represented in yellow arrows. Although it is simple to implement, it increases the total request number.

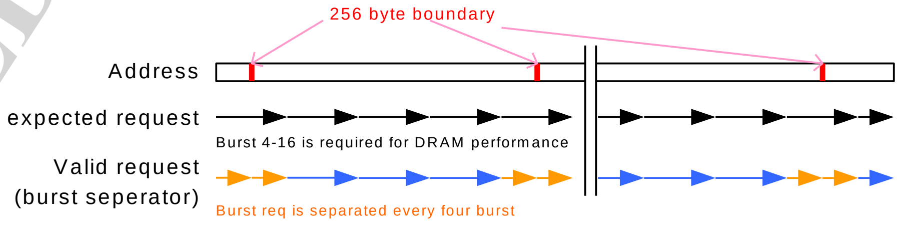

Figure 6-26. Scan-line request without considering 256-byte boundary

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

The second method is handling the 256-byte boundary restriction inside the control logics of ROT_DMA. After the data are stored in burst accumulator, ROT_DMA will adjust the burst length to meet the boundary when the target address is close to the 256-byte boundary. In common cases, the minimum burst length is a factor of 256 bytes; therefore the requests after the adjusted request will automatically align with the 256-byte boundary. This method is difficult to implement but can efficiently reduce the overhead of DMA requests (see Figure 6-27).

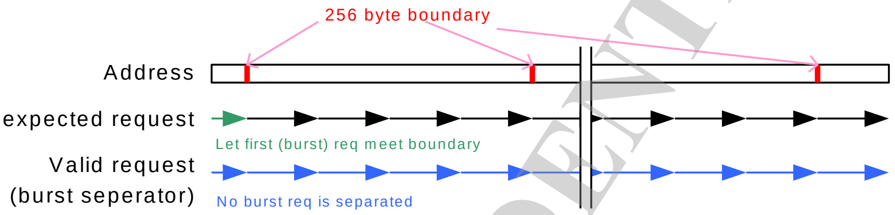

Figure 6-27. Scan-line request considering 256-byte boundary

6.9.5.3.2 SMI Boundary Restriction In Case of Rotation

The method described in the previous section is based on continuous scan-line access of DMA. It works only in 0° or 180° rotation with or without flip. Unfortunately, it does not always work in 90° or 270° rotation with or without flip. Considering a general condition with 90° or 270° rotation, if the stride is not multiple of 256 bytes, the distribution of 256-byte boundary will differ in every line as described in Figure 6-28. To handle this, the SMI_IF controller issues requests with different burst lengths according to the current address.

6.10 Display 2D Sharpness

6.10.1 Introduction

The sharpness function provides better picture quality for panel display. It restores the image details, sharpens the edge and provides a vivid feeling for pictures and videos.

6.10.2 Features

- 2-dimensional sharpness filter
- Peaking by color (PBC)

6.10.3 Block Diagram

Figure 6-29 is the block diagram of display 2D sharpness. The FIFO unit is used to pre-fetch pixel data, and thus the overall throughput can be improved in some situations.

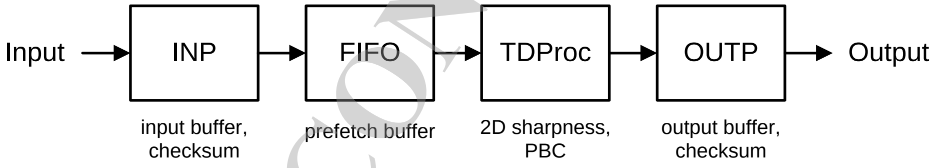

Figure 6-29. Block diagram of display 2D sharpness

Figure 6-30 is the block diagram of the sharpness core. The luminance data will be processed and modified in the sharpness function. The chrominance data will flow into PBC, but no modification at the output.

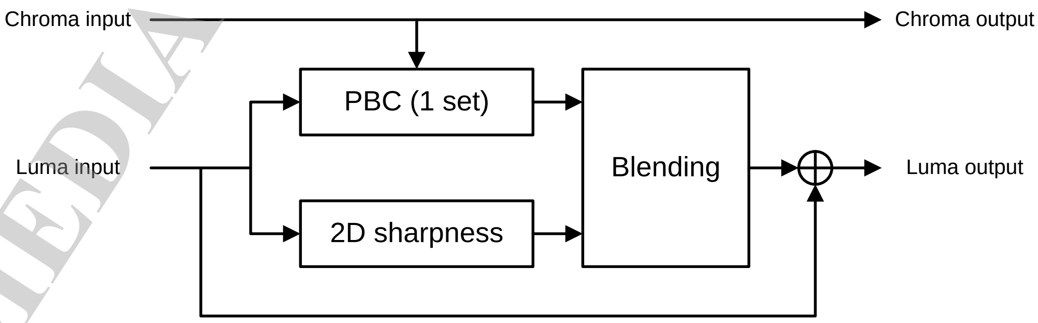

Figure 6-30. Block diagram of sharpness core

6.10.3.1 2-dimensional Sharpness

The 2D filters are used to extract middle/high-frequency components from the input signal. Each extracted AC component is enhanced individually and then added back to the input signal. The enhancement units are composed by coring, gain, limit and clip.

Before 2-dimensional sharpness After 2-dimensional sharpness

Figure 6-31. Visual effect of 2-dimensional sharpness

6.10.3.2 Peaking by Color

Sometimes you may prefer different sharpness levels in different color tones. PBC is used for such preference. PBC detects at most three different colors and applies different sharpness levels to them.

Before green PBC After green PBC

Figure 6-32. Visual effect of peaking by color

6.10.5 Programming Guide

6.10.5.1 Sharpness Adjustment

There are total three possible usage scenarios for different situations.

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL

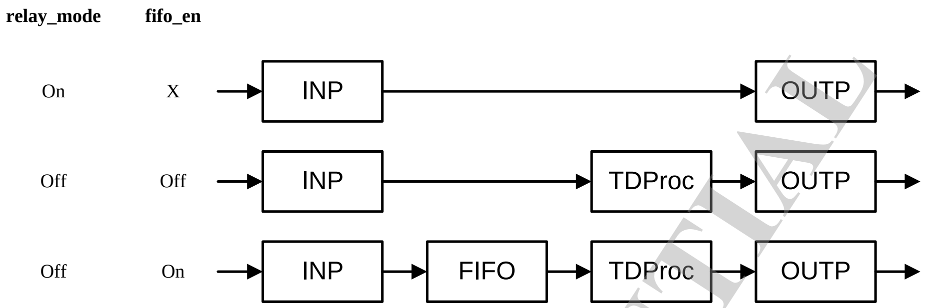

Figure 6-33. Usage scenarios

The sharpness function is designed to provide different sharpness levels. The sharpness level can be programmed by the gain curve control in the 2-dimensional sharpness unit. Higher sharpness level enhances more details of the image and sharpens the edge. However, sharpness setting that is too strong will induce some artificial side effects. Therefore, balance setting with enough sharpness level is preferred.

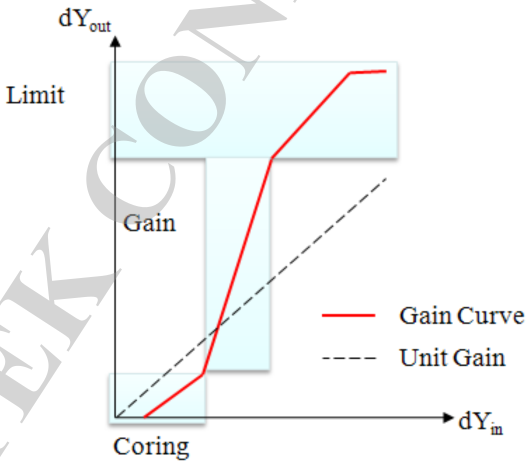

Figure 6-34. Gain curve control of sharpness

6.10.5.2 Luma Adjustment

The color processor applies a luma mapping curve to the input luma (see Figure 6-35). The full luma range is equally divided into 16 segments, and registers Y_FTN_*are responsible for the adjustments.

6.11 DISP_OVL

6.11.1 Introduction

The display OVERLAY can do alpha blending up to 4 layers. The 4 layer sources can be from MEMORY/constant layer color. Four RDMA is included in overlay and 4 sets of color transform are also included.

6.11.2 Features

The following table describes the features of DISP_OVL.

Item	Main function	Description
1	4K2K resolution	Supports 4096x2160
2	4 layer overlay	Supports 4 layers of blending (w/o multiplier)
3	Color format uniform	Supports color format uniform and swap control (RGB565/RGB888/RGBA8888/ARGB8888/YUYV/YUV2)
4	3D display	Interleave left and right image for 3D display (landscape and portrait mode)
5	Color conversion	Wide-gamma : sRGB/GPU/Adobe mode
6	Layer constant color	Constant color input for each layer source
7	Alpha blending	Supports pixel alpha blending + SurfaceFlinger alpha blending (G2D)
8	Flexible ROI system	Supports individual color depth, window size, vertical and horizontal offset
9	Flip function	Vertical/Horizontal/180 degree flip function

6.11.3 Block Diagram

There are four OVL_RDMA in DISP_OVL, and each OVL_RDMA contains a 128x128 single port SRAM (ping-pung buffer).

6.11.5 Programming Guide

Register settings:

1. Configure DATAPATH (number of layers, layer source, color format, etc).
2. Configure RDMA parameters (addr/size/fmt/swap).
3. Configure layer parameters (layer size/offset/roi size).

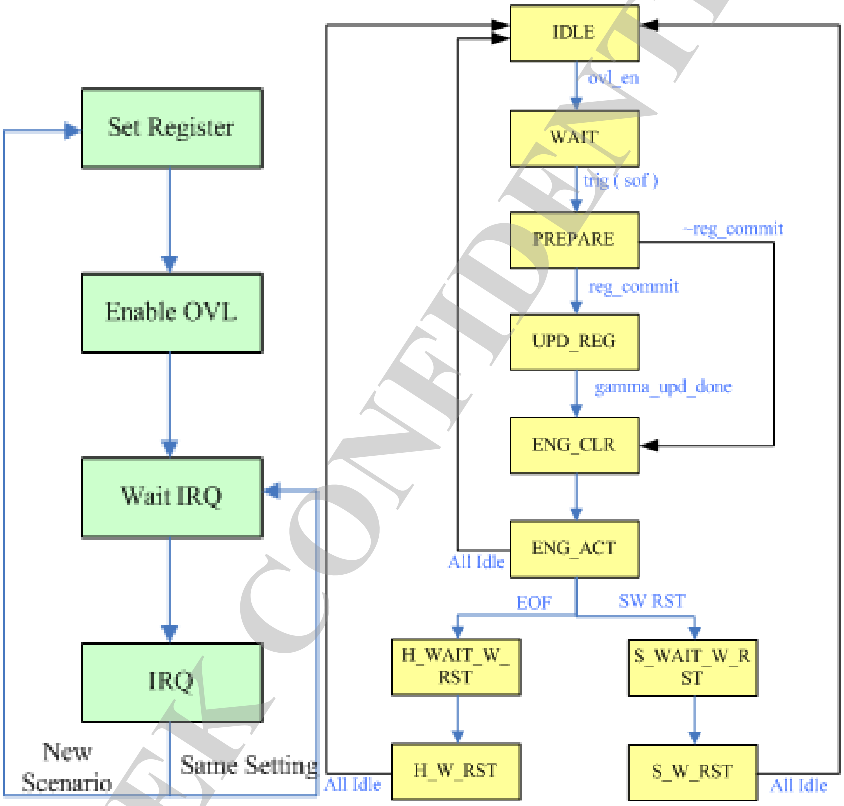

Figure 6-37. Typical DISP_OVL programming procedure

6.12 DISP RDMA (Display Read Direct Memory Access)

6.12.1 Introduction

The RDMA engine is responsible of providing data to the interface engines, e.g. DSI, DBI and DPI. Because the interface engines need the real time service, the RDMA engine contains one line buffer to store the sufficient pixel data. It also detects the usage of data buffer to trigger the deep sleep mode of EMI.

6.12.2 Features

- Direct link input mode
- Memory input mode
  - Input format: YUYV422, UYVY422, YVYU422, UYVY422, RGB565, RGB888, ARGB8888
  - Input footprint: Raster-scan mode, 64 byte-aligned tile mode
  - Slow down mode
- Output control
  - Byte swap, RGB swap
  - Progressive mode, Interlace mode
  - Programmable YUV to RGB matrix
  - Non-stop output mode if the data buffer is under-running
- Buffer control
  - 240x16 byte data buffer (1280 pixels with RGB888 format)
  - Programmable request/pre-ultra/ultra control mechanism

6.12.3 Block Diagram

The following figure shows the detailed block diagram of RDMA engine. The clocks are automatically configured and one asynchronous FIFO is used for the output clock domain.

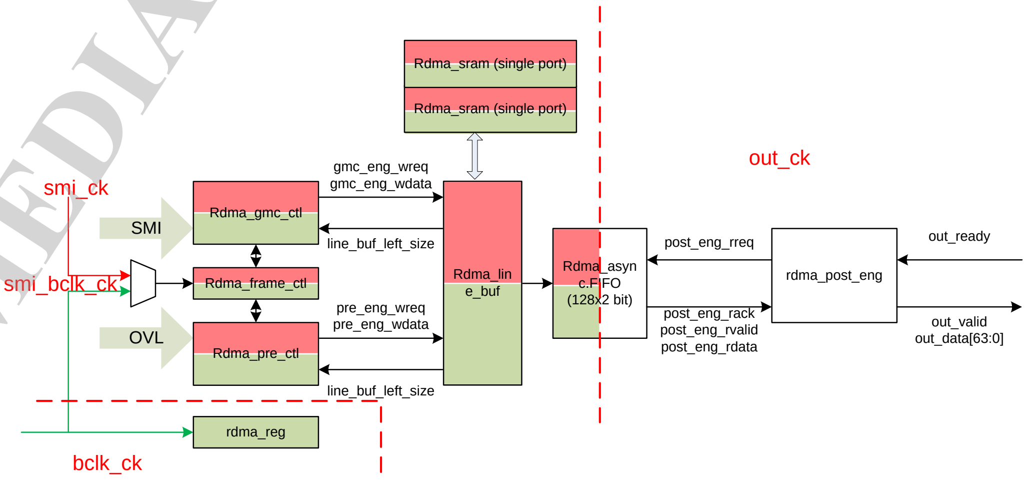

Figure 6-38. Block diagram of RDMA engine

6.12.5 Programming Guide

The figure below shows the general programming sequence.

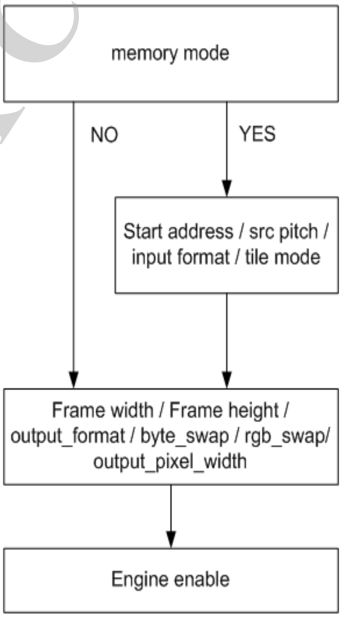

Figure 6-39. General programming sequence

The direct link mode can be easily configured by output frame width and height. On the other hand, the memory mode has several modes, which will be discussed in sub-sections.

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

6.12.5.1 Memory Mode Control: Raster Scan Input, Progressive Output

1. Set 'MEM_MODE_START_ADDR' = Address of the first pixel.
2. Set 'MEM_MODE_SRC_PITCH' = Width of the source frame.

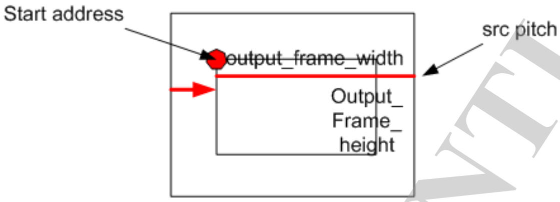

Figure 6-40. Basic memory mode configuration

6.12.5.2 Memory Mode Control: Raster Scan Input, Interlace Output

1. Set 'MEM_MODE_START_ADDR' = Address of the first pixel.
2. Set 'MEM_MODE_SRC_PITCH' = ***Double*** of the width of the source frame.

6.12.5.3 YUV to RGB Transfer Formula

$$\begin{pmatrix} Y_out \\ U_out \\ V_out \end{pmatrix} = \begin{pmatrix} C00 & C01 & C02 \\ C10 & C11 & C12 \\ C20 & C21 & C22 \end{pmatrix} \times \begin{pmatrix} Y_input + pre_add_0 \\ U_input + pre_add_1 \\ V_input + pre_add_2 \end{pmatrix} + \begin{pmatrix} post_add_0 \\ post_add_1 \\ post_add_2 \end{pmatrix}$$

Figure 6-41. Programmable color matrix

6.12.5.4 Byte Swap/RGB Swap

Set up the corresponding registers according to the data format on the memory.

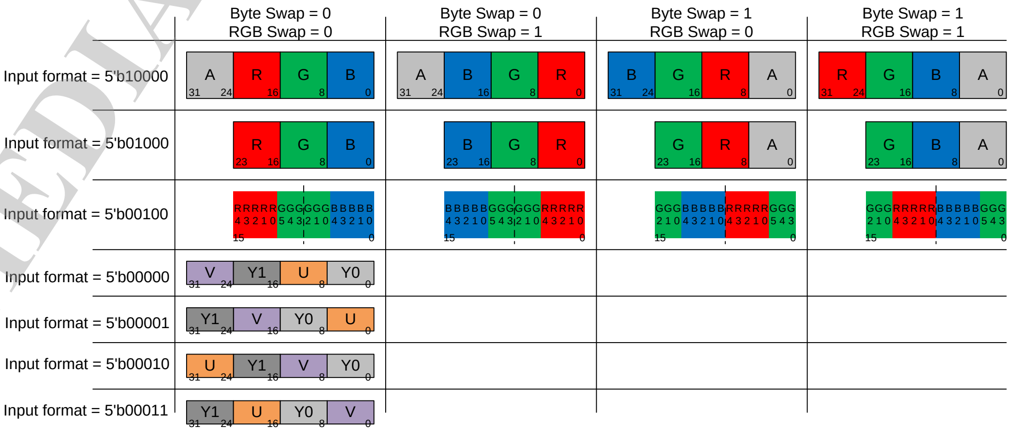

Figure 6-42. Byte/RGB swap

6.13 DISP_WDMA

6.13.1 Introduction

MDP_WDMA and DISP_WDMA have the same hardware architecture but slightly differ in SRAM size, which influences the line-width support and outstanding ability. WDMA does the job of DMA writing out the data in display/MDP pipeline into DRAM. In the following sections, WDMA is called DISP_WDMA.

6.13.2 Features

- Dither
- Programmable parameter color transform
- Input color format YUV444/RGB888
- Output format RGB565/RGB888/ARGB8888/UYVY/YV12/NV12/NV21
- 3-tap filter in horizontal and 2-tap filter in vertical for YUV420 down sample
- Byte swap/color swap/UV swap functions

6.13.3 Block Diagram

DISP_WDMA has a 256x128 two-port SRAM for DMA FIFO. One 320x64 single-port SRAM is for vertical filtering line_buffer (2560 pixels). For line-width larger than 2560, YUV420 vertical down sample must be drop-pixel scheme.

MDP_WDMA has a 128x128 two-port SRAM for DMA FIFO. One 64x64 single-port SRAM is for vertical filtering line_buffer (512 pixels). For line-width larger than 512, YUV420 vertical down sample must be drop-pixel scheme.

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Mnemonic	Name	Description
			4'b1101: BT601 to BT709
17	**UNICON**	UNI_CONFIG	**Uses uniform config or not** Do not modify this bit. 0: Disable uniform config 1: Enable uniform config
16	**SWAP**	SWAP	**Enables swap function to translate the output data format** Translated output data format: RGB565 -> BGR565 RGB888 -> BGR888 RGBA8888 -> BGRA8888 ARGB8888 -> ABGR8888 UYVY -> VYUY YUY2 -> YVYU IYUV -> YV12 NV12 -> NV21 0: Disable swap 1: Enable swap
15	**DNSP_SEL**	DNSP_SEL	**Selects YUV444 to YUV422 mode** 0: Drop odd pixel U/V 1: Apply [1 2 1] filter for U/V
13	**EXT_MTX_EN**	EXT_MTX_EN	**Enables color transformation external coefficients or not** For internal coefficient, use INT_MTX_SEL to select the pre-defined coefficients. For external coefficient, use register WDMA_C00 -> WDMA_POST_ADD. 0: Use internal coefficients for color transformation 1: Use External coefficients for color transformation
12	**V_AVG**	VERTICAL_AVG	**Enables vertical average or not** 0: Drop odd line pixels 1: Average in vertical while YUV444->YUV420
11	**CT_EN**	CT_EN	**Enables color transformation matrix or not** 0: Bypass color transformation matrix 1: Do color transformation
10	**UVS**	UV_SWAP	**Enables uv_swap or not** If the output format is UYVY (y1 v0 y0 u0), it will become (y1 u0 y0 v0) after UV swap. It takes no effect only when legacy mode and the output format is in RGB domain. 0: Disable UV swap 1: Enable UV swap
9	**RGBS**	RGB_SWAP	**Enables rgb_swap or not** If the output format is ARGB, it will become ABGR after RGB swap. It takes no effect only when legacy mode and the output format is in YUV domain. 0: Disable RGB swap 1: Enable RGB swap
8	**BYTES**	BYTE_SWAP	**Enables byte_swap or not** Takes no effect when output format is RGB565 or RGB888. If the output format is ARGB, it will become BGRA after byte swap. If the output format is UYVY(y1 v0 y0 u0), it will become (v0 y1 u0 y0) after byte swap. Only works in legacy mode. 0: Disable byte swap 1: Enable byte swap
7:4	**OF**	Out_Format	**Specifies output format of WDMA** 0: RGB565 1: RGB888 2: BGRA8888 3: ARGB8888

Bit(s)	Mnemonic	Name	Description
31:0	**Address2**	Address2	V address for YV12 output

6.13.5 Programming Guide

The fundamental key parts are base address/input output format/data strides in memory. If color transform is needed, color transform matrix will also be needed. Other setting such as dither/filter are optional.

WDMA_DST_ADDR_OFFSET0
WDMA_DST_ADDR_OFFSET1
WDMA_DST_ADDR_OFFSET2

The read result of WDMA_CT_DBG means the input counter of the WDMA.
The MSB part is line counter and the LSB part is pixel counter.
This can be used as debugging register.

The read result of WDMA_FLOW_CTRL_DBG means the current state of WDMA.

6.14 Color Processor

6.14.1 Introduction

The color management engine is highly configurable and programmable; it fits different display panels and satisfies different user preferences for various purposes.

Color management is designed for two applications, getting better picture quality, and having one panel resemble the other in their output characteristics. With color processor, you can obtain better picture quality experience, and manufactures have identical and controllable production quality more easily.

A GUI tool is also provided as an easy and intuitive interface to color management.

6.14.2 Features

The color processor is very flexible for luma/saturation/hue adjustments. Main features are:

- Flexible architecture: PQ processing at many possible stages
- Input/output color space conversion
- Hue engine:
  - Partial hue: Modifies hue angle of specific hue phase
- Y engine:
  - Adaptive luma: Adaptively adjusts Y curve according to image content
  - Global contrast/brightness adjustment
  - Chroma boost: Compensates saturation value due to Y change
- Sat engine:
  - Partial S: Modifies saturation value of specific hue phase
  - Global saturation adjustment
- Histogram statistics: Includes Y histogram and chroma histogram

6.14.3 Block Diagram

The color engine provides various luma/saturation/hue adjustments. See Figure 6-45 for the block diagram.

6.14.5 Programming Guide

6.14.5.1 Hue Adjustment

There are 20 hue phases for partial hue adjustment.

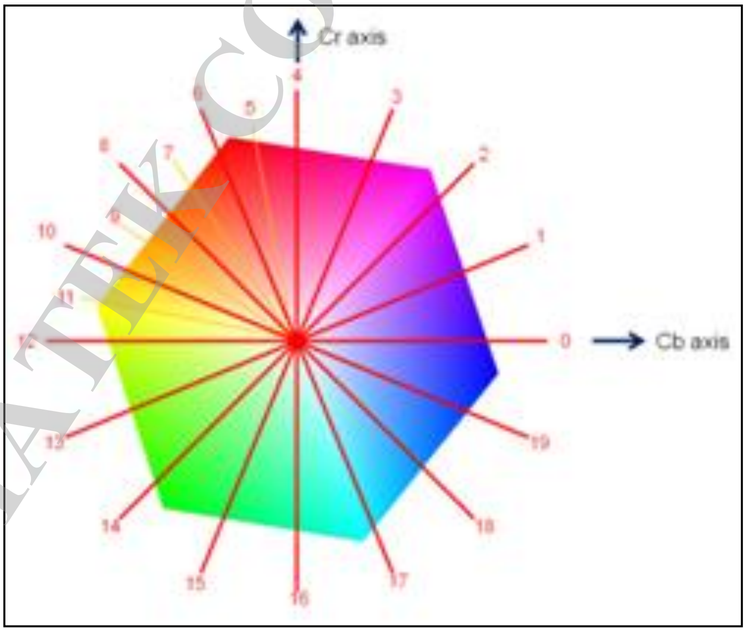

Figure 6-46. 20 hue phases distribution

Partial hue adjustment is achieved by HUE_TO_HUE_W_* registers. An example of partial hue adjustment is shown in Figure 6-47.

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

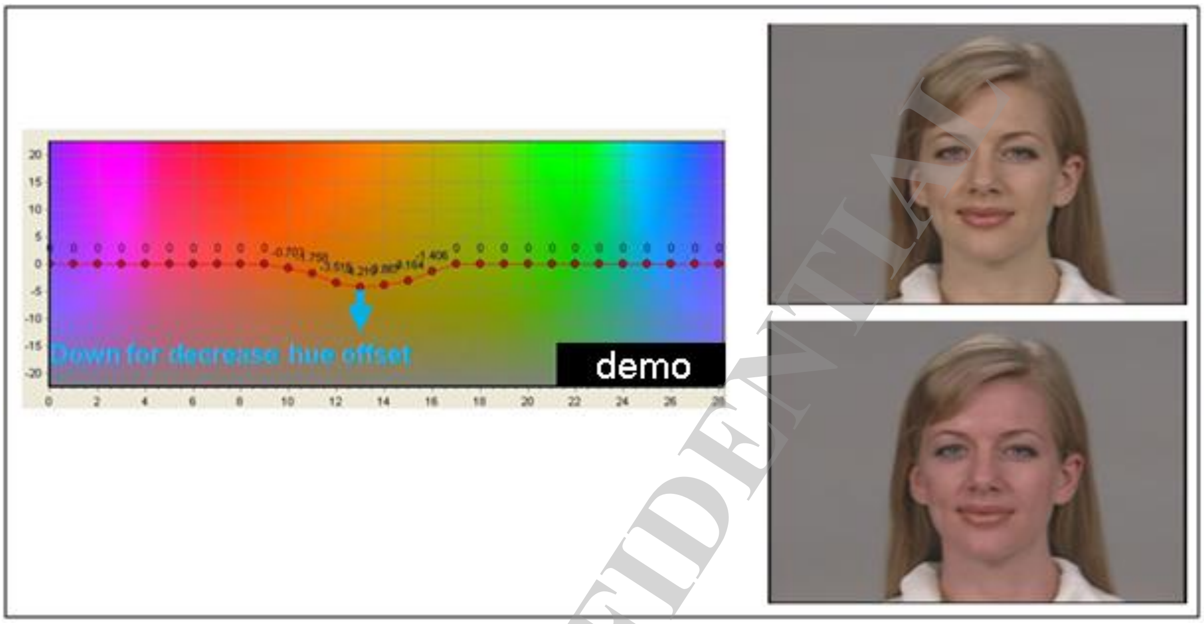

Figure 6-47. Partial hue adjustment example

6.14.5.2 Luma Adjustment

Global contrast and brightness adjustment are also provided for intuitive luma adjustment. The registers are G_CONTRAST and G_BRIGHTNESS (see Figure 6-48).

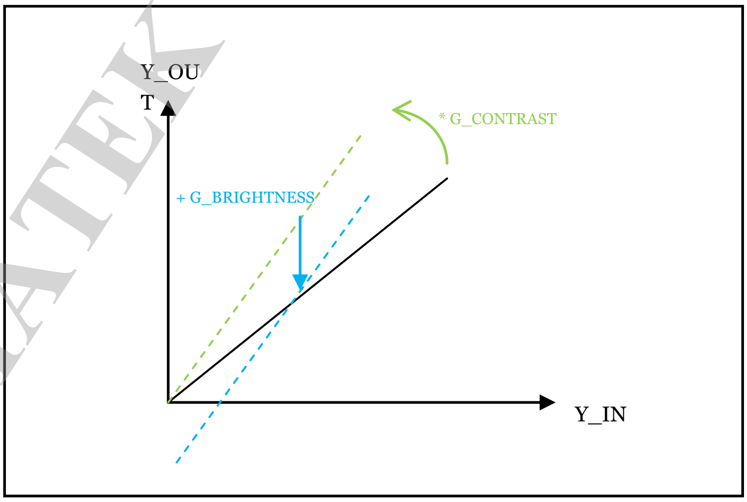

Figure 6-48. Contrast/brightness adjustment example

6.14.5.3 Saturation Adjustment

In human vision system, luminance increase results in pale images even the saturation is not decreased. Therefore, the color processor provides a "Chroma Boost" mechanism to detect the

luminance increasing amount and decides the corresponding saturation boost level. The control registers are *_CBOOST_*, and the formula is illustrated in Figure 6-49.

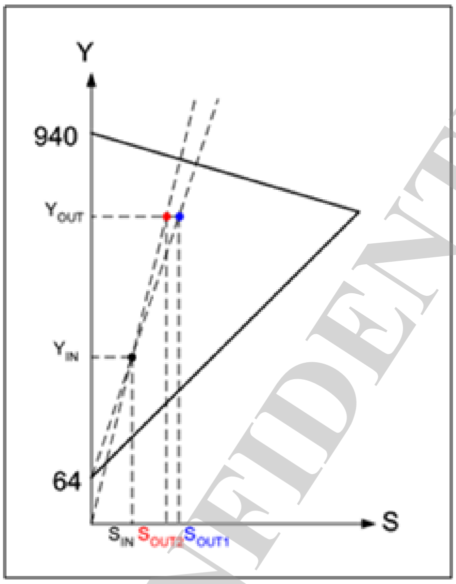

Figure 6-49. Chroma boost demonstration

For saturation adjustment, the color processor provides a flexible partial saturation adjustment. Similar to PartialHue, the hue plan is equally divided into 20 hue phases and saturation corresponding to each hue phase can be customized by three gains and two turning points. The adjustment for each hue phase are controlled by PARTIAL_SAT_GAIN*, PARTIAL_SAT_POINT*. Figure 6-50 shows the saturation adjustment in one hue phase.

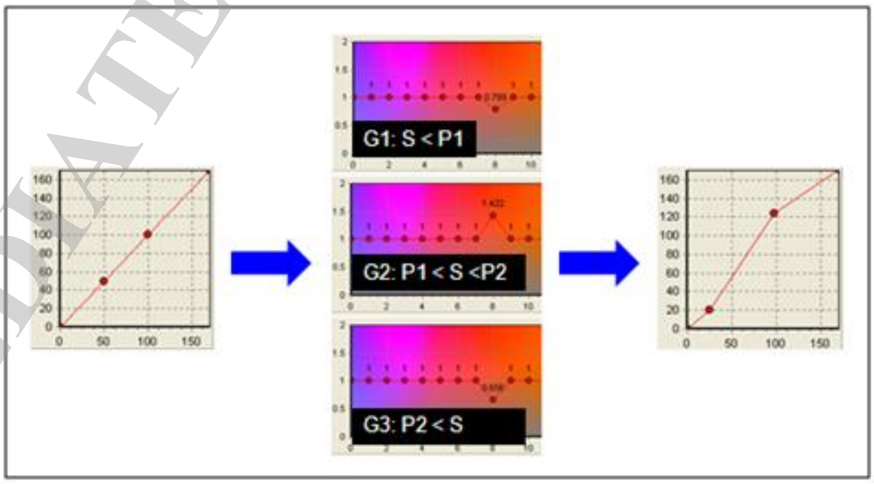

Figure 6-50. Example of partial S adjustment for one hue phase

A global saturation gain is provided for intuitive saturation adjustment. The control register is G_SATURATION (see Figure 6-51).

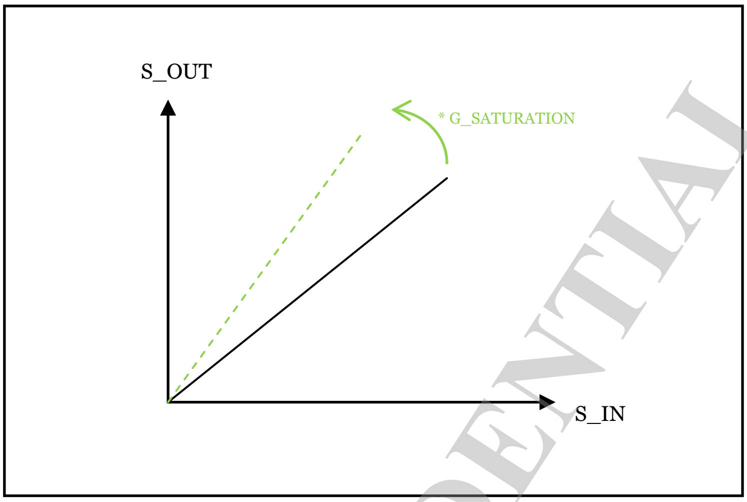

Figure 6-51. Illustration of global saturation adjustment

6.14.5.4 Color Matrix Conversion Programming

The color engine is equipped with input/output color matrix conversions. This makes possible that the color engine can operate in selectable processing stage. For example, the color engine can operate by RDMA engine's RGB or YCbCr outputs.

If RGB data are fed to the color engine, RGB to YCbCr conversion should be performed before color processing, and YCbCr to RGB conversion can be applied to the following engines.

6.15 DISP CCORR (Display Color Correction Engine)

6.15.1 Introduction

The color correction engine changes the overall mixture of RGB colors to fit the characteristics of target panel.

6.15.2 Features

- Fixed-coefficient inverse gamma table with wide-gamut support
- Programmable 3X3 matrix
- Fixed-coefficient gamma table

6.15.3 Block Diagram

Figure 6-52 is the block diagram of color correction core.

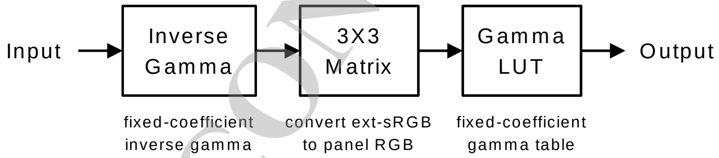

Figure 6-52. Block diagram of color correction

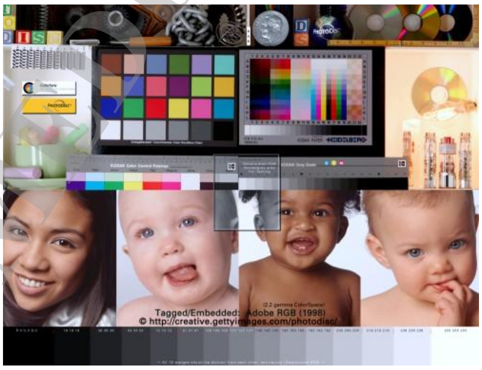
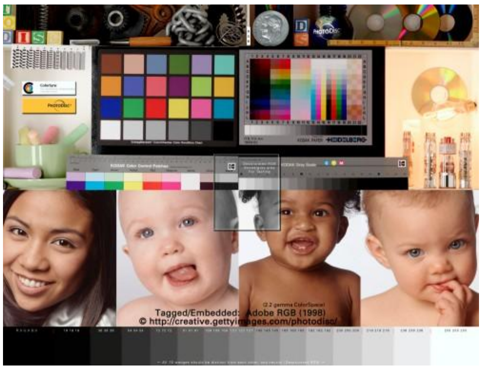
6.15.4 Color Correction

In order to display accurate image colors, the panel needs to match the standard sRGB color gamut. However, most LCD panels only display 65 to 80 percent of the sRGB color gamut. The OLED panels, on the other hand, can display over 130 percent of sRGB color gamut. With color correction, you can reproduce correct color on panels with different color gamuts.



Wide-gamut panel without color correction



Wide-gamut panel with color correction

6.16 DISP AAL (Display Adaptive Ambient Light Controller)

6.16.1 Introduction

The AAL processor, composed of content adaptive and ambient light adaptive, is responsible for backlight power saving and sunlight visibility improvement.

6.16.2 Features

- 33-bin weighted histogram
- DRE enhancement for sunlight visibility
- CABC compensation for backlight power saving

6.16.3 Block Diagram

Figure 6-54 is the block diagram of AAL processor.

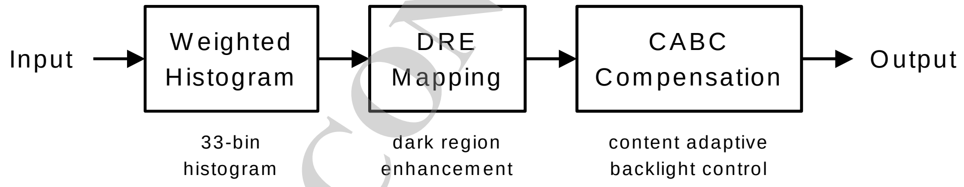

Figure 6-54. Block diagram of AAL processor

6.16.4 DRE Enhancement

Dark region enhancement improves the visibility under sunlight.

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Without DRE enhancement — With DRE enhancement

6.17 DISP GAMMA (Display GAMMA Processing Engine)

6.17.1 Introduction

The GAMMA engine changes the overall mixture of RGB colors to fit the characteristics of target panel.

6.17.2 Features

- 10-bit gamma table with 512 entries
- Non-block gamma LUT programming

6.17.3 Gamma correction

For accurate image reproduction, the transfer function of the panel should have a standard 2.20 gamma value. The gamma correction consists of three programmable look-up tables for RGB colors. It applies arbitrary mapping curve to compensate the incorrect transfer function of the panel.

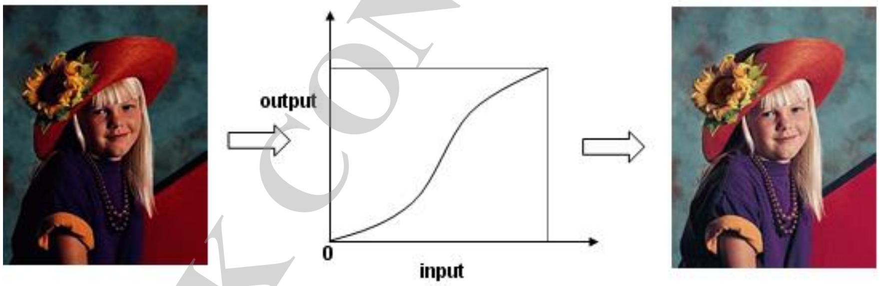

Figure 6-56. Visual effect of gamma correction

6.19 DISPLAY PWM Generator

6.19.1 Introduction

The PWM generator provides PWM signals for the LED driver of mobile LCM.

6.19.2 Features

- Operating clock: 26MHz (default) or 104MHz
- Gradual PWM control

6.19.3 Register Definition

Module name: DISP_PWM Base address: (+1100E000h)

Address	Name	Width	Register Function
1100E000	DISP_PWM_EN	32	**PWM Enable** Enables PWM
1100E004	DISP_PWM_RST	32	**PWM Reset** Resets PWM
1100E008	DISP_PWM_COMMIT	32	**PWM Commit** Commits PWM
1100E010	DISP_PWM_CON_0	32	**PWM Control 0** PWM control 0
1100E014	DISP_PWM_CON_1	32	**PWM Control 1** PWM control 1

6.19.4 Programming Guide

1. Turn on DISP_PWM operating clock.
2. Get MMSYS mutex.
3. Set up DISP_PWM_CON_0 and DISP_PWM_CON_1.
4. Write DISP_PWM_EN = 1.
5. Release MMSYS mutex.

6.20 DPI (Digital Parallel Interface)

6.20.1 Introduction

The DPI controller provides data to the companion chip, such as HDMI, MHL, or other bridge chips.

6.20.2 Features

- Programmable 2D/3D, progressive/interlaced timing generator
- Programmable EAV, SAV embedded sync. Timing
- Fixed-coefficient color space transform
- Supports RGB 8-bit/YUV444 8-bit/YUV422 8-bit,10-bit,12-bit output data format
- Supports YC MUX (CCIR656-like) output format
- Support s dual edge output format
- Supports secure display
- 3-tap chroma LPF
- Internal pattern generator

6.20.3 Register Definition

Module name: DISP_DPI Base address: (+14013000h)

Address	Name	Width	Register Function
14013000	DPI_EN	32	**DPI Enable Register** DPI enable signal
14013004	DPI_RST	32	DPI Software Reset Register
14013008	DPI_INTEN	32	**DPI IRQ Enable Register** DPI interrupt enable of individual interrupt source
1401300C	DPI_INTSTA	32	**DPI IRQ Status Register** DPI interrupt status
14013010	DPI_CON	32	**DPI Control Register** Controls DPI
14013014	DPI_OUTPUT_SETTING	32	DPI Output Stage Setting Register
14013018	DPI_SIZE	32	DPI Size Register
1401301C	DPI_DDR_SETTING	32	DPI DDR Register
14013020	DPI_TGEN_HWIDTH	32	**DPI Timing Generator Horizontal Sync Pulse Width Control Register** Controls DPI timing generator horizontal sync pulse width.
14013024	DPI_TGEN_HPORCH	32	**DPI Timing Generator Horizontal Front/Back Porch Control Register** Controls DPI timing generator horizontal front/back porch.
14013028	DPI_TGEN_VWIDTH	32	**DPI Timing Generator Vertical Sync Pulse Width Control Register** Controls DPI timing generator vertical sync pulse width (left frame, odd field).
1401302C	DPI_TGEN_VPORCH	32	**DPI Timing Generator Vertical Front/Back Porch Control Register**

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL

Address	Name	Width	Register Function
			Controls DPI timing generator vertical front/back porch (left frame, odd field).
14013030	DPI_BG_HCNTL	32	**DPI Background Horizontal Control Register** Controls DPI background horizontal
14013034	DPI_BG_VCNTL	32	DPI Background Vertical Control Register
14013038	DPI_BG_COLOR	32	DPI Background Color Register
1401303C	DPI_FIFO_CTL	32	**DPI FIFO CTL** Controls DPI FIFO
14013040	DPI_STATUS	32	**DPI Status Register** DPI current status
14013044	DPI_TMODE	32	**DPI Test Mode Register** Controls DPI test mode
14013048	DPI_CHKSUM	32	**DPI Checksum Register** Controls DPI checksum
14013050	DPI_DUMMY	32	
14013068	DPI_TGEN_VWIDTH_LEVEN	32	DPI Timing Generator Vertical Sync Pulse Width Control Register (Left Frame, Even Field)
1401306C	DPI_TGEN_VPORCH_LEVEN	32	DPI Timing Generator Vertical Front/Back Porch Control Register (Left Frame, Even Field)
14013070	DPI_TGEN_VWIDTH_RODD	32	DPI Timing Generator Vertical Sync Pulse Width Control Register (Right Frame, Odd Field)
14013074	DPI_TGEN_VPORCH_RODD	32	DPI Timing Generator Vertical Front/Back Porch Control Register (Right Frame, Odd Field)
14013078	DPI_TGEN_VWIDTH_REVEN	32	DPI Timing Generator Vertical Sync Pulse Width Control Register (Right Frame, Even Field)
1401307C	DPI_TGEN_VPORCH_REVEN	32	DPI Timing Generator Vertical Front/Back Porch Control Register (Right Frame, Even Field)
14013080	DPI_ESAV_VTIM_LODD	32	**EAV/SAV V Timing Control Register (Left ODD Frame)** Controls EAV/SAV V timing (left odd frame)
14013084	DPI_ESAV_VTIM_LEVEN	32	**EAV/SAV V Timing Control Register (Left EVEN Frame)** Controls EAV/SAV V timing (left even frame)
14013088	DPI_ESAV_VTIM_RODD	32	**EAV/SAV V Timing Control Register (Right ODD Frame)** Controls EAV/SAV V timing (right odd frame)
1401308C	DPI_ESAV_VTIM_REVEN	32	**EAV/SAV V Timing Control Register (Right EVEN Frame)** Controls EAV/SAV V timing (right even frame)
14013090	DPI_ESAV_FTIM	32	**EAV/SAV F Timing Control Register** Controls EAV/SAV F timing
14013094	DPI_CLPF_SETTING	32	Chroma Low-Pass Filter Setting Register
14013098	DPI_Y_LIMIT	32	Y (G) Channel Limit Setting Register
1401309C	DPI_C_LIMIT	32	C (R, B) Channel Limit Setting Register
140130A0	DPI_YUV422_SETTING	32	YUV444 To YUV422 Transform Setting Register
140130A4	DPI_EMBSYNC_SETTING	32	Embedded Sync Setting Register
140130A8	DPI_ESAV_CODE_SET0	32	Embedded Sync Setting Register
140130AC	DPI_ESAV_CODE_SET1	32	Embedded Sync Setting Register
140130B0	DPI_BLANK_CODE	32	Blanking Code Setting Register

6.20.4 Programming Guide

6.20.4.1 General Timing Programming

Programming DPI for one frame timing is easy. Figure 6-57 is illustration of the general timing relationship in DPI. The optional BG defines the region of background color in the image frame. The polarities of VS/HS/DE are all adjustable.

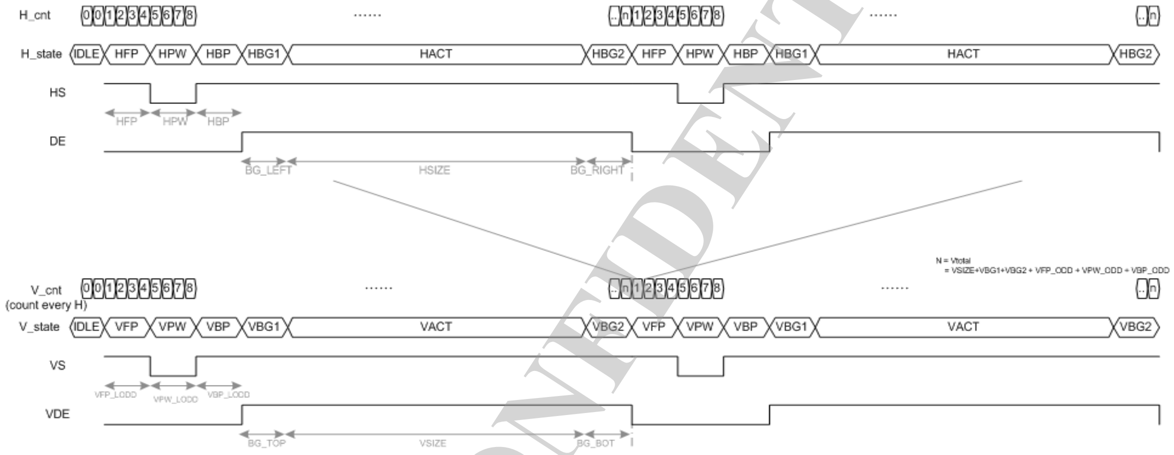

Figure 6-57. Illustration of general timing relationship

6.20.4.2 Data Timing Programming

The DPI engine supports four data/clock timing combinations in dual edge mode. In dual edge mode, one pixel is sent by 2 clock edges, and the order of sending MSB (High bits) and LSB (Low bits) is configurable. Another option is determining sending first half pixel by rising or falling clock edge. Figure 6-58 shows the data/clock timing and their corresponding settings in 4 cases.

6.21 Display Serial Interface

6.21.1 Introduction

The Display Serial Interface (DSI) is based on MIPI Alliance Specification, supporting high-speed serial data transfer between host processor and peripheral devices such as display modules. DSI supports both video mode and command mode data transfer defined in MIPI spec, and it also provides bidirectional transmission with low-power mode to receive messages from the peripheral. DSI should work with MIPI_TX_Config module to obtain its engine clock to analog DPHY macro, and it should work with DMA engines in the previous stage of DISP path to read frame pixels from memory.

6.21.2 Features

The DSI engine has the following features for display serial interface:

- 1 clock lane and up to 4 data lanes
- Throughput up to 1G bps for 1 data lane
- Bidirectional data transmission in low-power mode in data lane 0
- Uni-directional data transmission in high-speed mode in data lane 0 ~ 3
- 128-enrty command queue for command transmission
- Supports 3 types of video modes: sync-event, sync-pulse, burst mode
- Pixel format of RGB565/RGB666/loosely RGB666/RGB888
- Supports non-continuous high-speed transmission in both clock/data lanes
- Supports command mode frame transmission free-run
- Supports peripheral TE and external TE signal detection
- Supports limited high-speed residual packet transmission during video mode blanking period
- Supports ultra-low power mode control
- Supports frame compression with UFOE module
- Supports low frame-rate (LFR) technique

6.21.3 Register Definition

Bit(s)	Name	Description
31:24	CM_DATA_1	**Command packet data byte 1** If short packet, the byte will be used as DATA 1. If long packet, this registers should be 0 because word count should be less than 16 bytes.
23:16	CM_DATA_0	**Command packet data byte 0** If short packet, the byte will be used as DATA 0. If long packet, this registers should be used as Word Count 0 for long packet
15:8	CM_DATA_ID	**Command packet data ID** Note: The packet data ID should contain both data type and VC.
5	TS_VFP_EN	**Command packet is allowable in VFP period** 0: Disable 1: Enable
4	TS_VBP_EN	**Command packet is allowable in VBP period** 0: Disable 1: Enable
3	TS_VSA_EN	**Command packet is allowable in VSA period** 0: Disable 1: Enable
2	TIME_SEL	**Timing interval for transmission** Allowable timing interval for command transmission in BLLP period. Select RGB if the HBP interval length is shorter than long packet length to be sent. 0: HBP timing interval 1: RGB timing interval
1	LONG_PKT	**Command packet type** 0: Short packet 1: Long packet
0	VM_CMD_EN	**Enables video mode command packet transmission** 0: Disable 1: Enable

14011134 **DSI_VM_CMD_DATA0** **DSI Video Mode Command Packet Data Byte 0~3 Register** **00000000**

6.21.4 Programming Guide

6.21.4.1 Clock Control

After enabling PLL clock from MIPI DPHY macro and CG cells in MMSYS, a primary module clock enable should be set to turn on for the entire design (see Table 6-8). To disable clock for DSI, unset it. For more details on MIPI DPHY PLL clock control, refer to the functional specification of MIPI TX Config module.

Table 6-8. Sequence to enable module clock

Step	Description	R/W	Register [bit]	Value
1	Enable primary module clock	W	DSI_COM_CON [1]	1

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL

6.21.4.2 DSI HS Clock Control

After enabling the module clock and properly setting up the related registers, it is necessary to enable the clock lane before starting high-speed data transmission by setting up the DSI_PHY_LCCON register. Please follow the steps shown in Table 6-9 to turn on the high-speed clock.

Table 6-9. Sequence to enable high-speed clock

Step	Description	R/W	Register [bit]	Value
1	Enable DSI high-speed clock	W	DSI_PHY_LCCON [0]	1

To disable high-speed clock, follow steps in Table 6-10. Sequence of exiting ultra-low power mode on clock lane Note that the high-speed clock should be turned off before ultra-low power mode.

Table 6-10. Sequence of exiting ultra-low power mode on clock lane

Step	Description	R/W	Register [bit]	Value
1	Disable DSI high-speed clock	W	DSI_PHY_LCCON [0]	0

6.21.4.3 DSI ULPS Enter Control

In cetain condition, the DISP subsys may be powered off after DSI entering the *ultra-low power state* (ULPS) to reduce more power consumption. ULPS is a protocol defined in MIPI spec and force LCM to enter standby scenario to save power. The sleep-in control in this module is shown in Table 6-11.

Table 6-11. Sequence of sleep-in control (entering ultra-low power mode)

Step	Description	R/W	Register [bit]	Value
1	Disable DSI high-speed clock	W	DSI_PHY_LCCON [0]	0
2	Data lane enter ultra-low power mode	W	DSI_PHY_LD0CON [1]	1
3	Clock lane enter ultra-low power mode	W	DSI_PHY_LCCON [1]	1

6.21.4.4 DSI ULPS Exit Control

To wake up DSI and LCM from ULPM, executing an "ULPS-exit" procedure defined by MIPI spec is required. This procedure performs a protocol to get DP/DN signals from LP-00 through LP-10 to LP-11, where the LP-10 period should not be less than 1ms. The procedure can be easily controlled by the DSI sleep-out sequence with an interrupt indication in Table 6-12. Note that ULPS_WAKEUP_PRD should be changed according to different MIPI frequency to make sure wake-up time is not less than 1ms.

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL

Table 6-12. Sequence of sleep-out control (exiting ultra-low power mode)

Step	Description	R/W	Register [bit]	Value
1	Enable sleep-out interrupt	W	DSI_INTEN [6]	1
2	Configure corresponding cycle counts for ULPS wakeup period according to current MIPI frequency (ex. 1Gbps)	W	DSI_TIME_CON0 [15:0]	0x80
3	Recover lane number (4-lane)	W	DSI_TXRX_CON [5:2]	0xF
4	Sleep-out start	W	DSI_START [2]	1
5	Issue interrupt and sleep-out done	R	DSI_INTSTA [6]	1
6	Clear interrupt	W	DSI_INTSTA [6]	1

6.21.4.5 DPHY Timing Control

All of the timing parameters defined in MIPI DPHY should be properly written in the DSI registers for correct timing control. The written value is based on the DSI internal clock cycle period which is related to DPHY PLL clock settings through MIPI TX Config engine.

For example, the timing parameter $T_{HS\text{-}PREPARE}$ is mandatory to be between 40ns+4*UI and 85ns +6*UI, where UI means time interval, equal to the duration of any HS state on clock lane. If the clock lane is set to 500MHz frequency, as well as bit-rate 1Gbps, the UI should be 1ns. In other words, the value of $T_{HS\text{-}PREPARE}$ must be between 44 ~ 91ns. The internal DSI clock is 4x divided by clock lane, as well as 125MHz. To satisfy $T_{HS\text{-}PREPARE}$, the register value DA_HS_PREP should be 6 ~ 11 (see Table 6-13).

Table 6-13. DPHY timing parameters register settings

	Timing specification	Absolute time for UI: 1ns	DA_HS_PREP value
$T_{HS\text{-}PREPARE}$	40ns+4*UI ~ 85ns +6*UI	44 ~ 91 ns	6 ~ 11

Table 6-14 lists the timing parameters which should be configured in the DSI registers. Note that for different bit-rate requirements, the UI values are various. For more precise timing control, select DPHY clock as fast as possible. However, the faster DPHY clock is set, the more the power waste. A suitable clock is beneficial to the optimization of system power consumption.

Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Table 6-14. DPHY global operation timing parameter defined by MIPI spec

Parameter	Description	Min	Typ	Max	Unit	Notes
$T_{CLK-MISS}$	Detection time that the clock has stopped toggling			60	ns	1
$T_{CLK-POST}$	Time that the transmitter shall continue sending HS clock after the last associated Data Lane has transitioned to LP mode	60 ns + 52*UI			ns	
$T_{CLK-PRE}$	Time that the HS clock shall be driven prior to any associated Data Lane beginning the transition from LP to HS mode	8			UI	
$T_{CLK-PREPARE}$	Time to drive LP-00 to prepare for HS clock transmission	38		95	ns	
$T_{CLK-TERM-EN}$	Time to enable Clock Lane receiver line termination measured from when Dn crosses $V_{IL,MAX}$	Time for Dn to reach $V_{TERM-EN}$		38	ns	
$T_{CLK-TRAIL}$	Time to drive HS differential state after last payload clock bit of a HS transmission burst	60			ns	
$T_{CLK-PREPARE} + T_{CLK-ZERO}$	$T_{CLK-PREPARE}$ + time for lead HS-0 drive period before starting Clock	300			ns	
$T_{D-TERM-EN}$	Time to enable Data Lane receiver line termination measured from when Dn crosses $V_{IL,MAX}$.	Time for Dn to reach $V_{TERM-EN}$		35 ns + 4*UI		
T_{EOT}	Time from start of $T_{HS-TRAIL}$ or $T_{CLK-TRAIL}$ period to start of LP-11 state			105 ns + n*12*UI		3
$T_{HS-EXIT}$	Time to drive LP-11 after HS burst	100			ns	
$T_{HS-PREPARE}$	Time to drive LP-00 to prepare for HS transmission	40 ns + 4*UI		85 ns + 6*UI	ns	
$T_{HS-PREPARE} + T_{HS-ZERO}$	$T_{HS-PREPARE}$ + Time to drive HS-0 before the Sync sequence	145 ns + 10*UI			ns	
$T_{HS-SKIP}$	Time-out at RX to ignore transition period of EoT	40		55 ns + 4*UI	ns	
$T_{HS-TRAIL}$	Time to drive flipped differential state after last payload data bit of a HS transmission burst	max(n*8*UI, 60 ns + n*4*UI)			ns	2, 3
T_{INIT}	Initialization period (PHY might calibrate)	100			µs	
T_{LPX}	Length of any Low-Power state period	50			ns	4
Ratio T_{LPX}	Ratio of $T_{LPX(MASTER)}/T_{LPX(SLAVE)}$ between Master and Slave side	2/3		3/2		
T_{TA-GET}	Time to drive LP-00 by new TX		5*T_{LPX}		ns	
T_{TA-GO}	Time to drive LP-00 after Turnaround Request		4*T_{LPX}		ns	
$T_{TA-SURE}$	Time-out before new TX side starts driving	T_{LPX}		2*T_{LPX}	ns	
T_{WAKEUP}	Recovery time from Ultra-Low Power State	1			ms	

The registers of timing parameters for data lanes and clock lane are illustrated in Figure 6-60 and Figure 6-61 respectively. The registers for BTA (Bus Turn-Around) timing are illustrated in Figure 6-62.

6.21.5 Command Mode

DSI supports command mode transmission through writing commands to a dedicated command queue. By configuring commands and triggering, the transmission can be executed sequentially.

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

6.21.5.1 Command Queue

DSI has a dedicated command queue that are 32-bit wide and up to 128-entry deep, as shown in Figure 6-63. To simplify the settings for transmitting a packet in the command mode, the command queue is designed to categorize all possible transmission types and commands into four primary instructions and unifies all DSI specification commands into one or several 32-bit wide instructions. Figure 6-63 also illustrates a 32-bit instruction structure with the instruction format of CONFG byte.

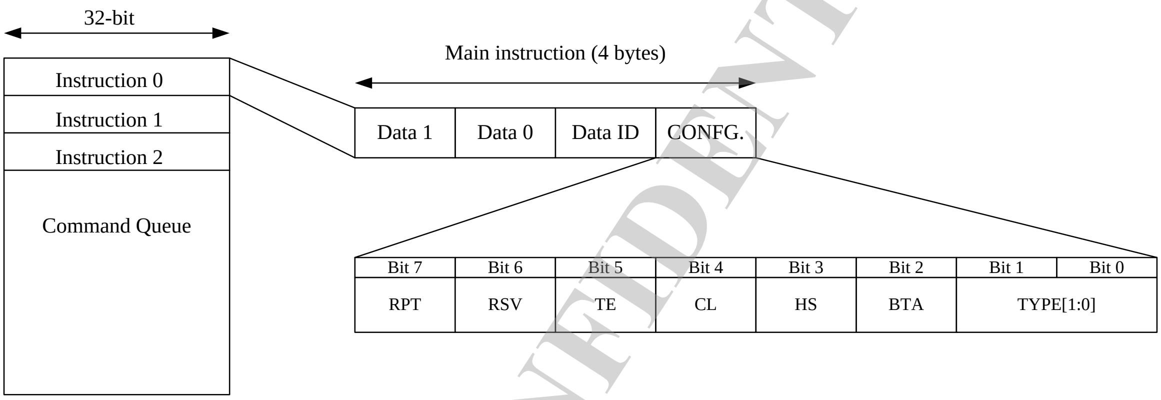

Figure 6-63. DSI command queue instruction format

Table 6-15 shows the descriptions of the CONFG byte to a instruction. For convenience's sake, virtual channel 0 is used for all packets in the following examples. Software programmers should take charge of the real virtual channel numbers to the slave devices.

Table 6-15. Config. field description of main instruction

	Value	Function	Description
Type[1:0]	00	-	Used for DSI short packet read/write command
	01	-	Used for DSI frame buffer write command (long packet)
	10	-	Used for DSI generic long packet write command
	11	-	Used for DSI frame buffer read command (short packet)
BTA	0	Off	Turns around the DSI link after the DSI command is transmitted
	1	On	
HS	0	Off	Enables HS Tx transmission for this packet; otherwise transmit packet via LP Tx
	1	On	
CL	0	8-bit	Selects command length for frame buffer read/write instruction. Only effective for type 1 and type 3 instructions.
	1	16-bt	
TE	0	Off	Enables TE request. Will only turn around the DSI link without any packet transmission
	1	On	
Resv	-	-	Reserved for further use
Resv	-	-	Reserved for further use

6.21.5.2 Type-0 Instruction

Type-0 instruction is used to transmit short packets. Figure 6-64 lists the formats of type-0 instruction where (Data ID + Data 0 + Data 1) is constructed by a DSI short packet command (without ECC).

Byte 3	Byte 2	Byte 1	Byte 0
Data 1	Data 0	Data ID	CONFG.

Figure 6-64. Type-0 instruction format

Suppose we are to send "Turn On Peripheral" and "Color Mode On" commands which are transmitted via LP Tx and HS Tx respectively and request slave response after the second command finished, the descriptions can be translated into two 32-bit instructions and achieved by the steps illustrated in Table 6-16.

Table 6-16. Type-0 Tx example

Step	Description	R/W	Register [bit]	Value
1	Fill command queue entry-0	W	DSI_CMDQ_0	0x0000120C
2	Fill command queue entry-1	W	DSI_CMDQ_1	0x00003200
3	Set command count	W	DSI_CMDQ_CON	0x2
4	Start command	W	DSI_START [0]	0x1
5	Issue interrupt and receive slave response	R	DSI_INTSTA [0]	0x1
6	Clear interrupt status	W	DSI_INTSTA [0]	0x1
7	Read trigger status (Acknowledge)	R	DSI_RX_TRIG_STA [3:0]	0x4
8	Reponse read ack to module and go to next commends in queue	W	DSI_RX_RACK [0]	0x1
9	Issue interrupt and command done	R	DSI_INTSTA [1]	0x1
10	Clear interrupt status	W	DSI_INTSTA [1]	0x1

6.21.5.2.1 Type-1 Instruction

Type-1 command is used to write data into the frame buffer. As shown in Figure 6-65, there are 4 bytes constructing this type of instruction where mem_start_0 and mem_start_1 can be generic commands defined by slave vendors or DCS commands. mem_start_1 is optional, i.e. the memory start/continue command can be single-byte as DCS defines. To indicate whether the DSI controller sends mem_start_1 or not depends on the CL bit of the CONFG. byte. Since the length of frame butter to be updated is not a constant, this type of instruction may send several long packets to the slave. The payload data and length of each packet (excluding mem_start_0 and mem_start_1) is prepared by the RDMA controller which couples the output of image data path or layer overlay result to the DSI controller. For the first packet, mem_start_0 and mem_start_1 (if CL = 1) are used as the parameters to inform the slave that the host is starting to write the frame buffer. For the remaining packets, the register value MEM_CONTI[15:0] will be used as the parameters to inform the slave side to write these data following the last pixel of the previous packet. For more flexibility, mem_start_0,

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL

mem_start_1, MEM_CONTI[15:0] and CL are all programmable. However, it consumes only one entry of command queue.

The user needs to set up two registers to define the packet length and packet count for a frame-based type-1 transmission. Frame width in bytes should be set to DSI_PSCON, and frame height in lines should be set to DSI_VACT_NL, respectively. These two registers are used in both video and command mode frame data transmission.

Byte 3	Byte 2	Byte 1	Byte 0
Mem start 1 (optional)	Mem start 0	Data ID	CONFG.

Figure 6-65. Type-1 instruction format

Follow the example in Table 6-17 to write the frame buffer via DCS command in the HS Tx mode.

Table 6-17. Type-1 Tx example

Step	Description	R/W	Register [bit]	Value
1	Fill command queue entry-0	W	DSI_CMDQ_0	0x002C3909
2	Set command count	W	DSI_CMDQ_CON	0x1
3	Set memory continue command	W	DSI_MEM_CONTI [15:0]	0x3C
4	Start command	W	DSI_START [0]	0x1
5	Issue interrupt and command done	R	DSI_INTSTA [1]	0x1
6	Clear interrupt status	W	DSI_INTSTA [1]	0x1

6.21.5.2.2 Type-2 Instruction

Type-2 instruction is used to send a long packet. As shown in Figure 6-66, this type of main instruction requires several sub-instructions which do not have CONFIG. To send a type-2 command, the user needs to write a CONFIG with TYPE = 2 and packet header information (Data ID + 2 byte word count) to enrty 0, and a series of data bytes in size of word count to the following entries, excluding ECC and checksum. The bytes in following entries will be treated as long packet data instead of the next instruction until the word count size is reached. The command queue count should be set as the number of multiple entries used.

The type-2 command is sent in LPTX mode due to memory latency in reading sub-instruction data. Besides, type-2 command should be sent individually without the next instruction followed. For the 32-entry command queue, the maximum word count for long packet is 124 bytes.

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Byte 3	Byte 2	Byte 1	Byte 0
WC 1	WC 0	Data ID	CONFG.
Data 3	Data 2	Data 1	Data 0
		Data WC-1	Data WC-2

Figure 6-66. Type-2 instruction format

See Table 6-18 below for the example of sending 3 parameters (0x33, 0x22, 0x11) by a generic long packet command with 3-byte word count.

Table 6-18. Type-2 Tx example

Step	Description	R/W	Register [bit]	Value
1	Fill command queue entry-0 (data ID and word count)	W	DSI_CMDQ_0	0x00032902
2	Fill command queue entry-1 (parameters)	W	DSI_CMDQ_1	0x00112233
3	Set command count	W	DSI_CMDQ_CON	0x2
4	Start command	W	DSI_START [0]	0x1
5	Issue interrupt and command done	R	DSI_INTSTA [1]	0x1
6	Clear interrupt status	W	DSI_INTSTA [1]	0x1

Note that the RPT bit of CONFIG. is designed for this type of instruction. It is useful for the NULL packet or blanking packet. For example, if a null packet is to be sent, only the main instruction (entry-0 of command queue) will be needed, the following payload data will be sent as “0”.

6.21.5.2.3 Type-3 Instruction

Type-3 instruction is used for reading frame buffer. As shown in Figure 6-67, the format is the same as that of type-1. When this instruction is executed, the host will first send a short packet with memory start parameter given in byte 2 and byte 3 and automatically issue the next packet by memory continue parameters programmed in MEM_CONTI[15:0]. The number of total packets required to be sent depends on the FRM_BC and “maximum return packet size”. For example, if we are to read 1,024 bytes from the frame buffer in the slave, and the “maximum return packet size” is set to “4”, after the first short packet described in main instruction is sent, there will be another 255 short packets with memory continue parameters to be sent successively.

Byte 3	Byte 2	Byte 1	Byte 0
Men start 1 (optional)	Mem start 0	Data ID	CONFG.

Figure 6-67. Type-3 instruction format

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.

See Table 6-19 for the example of using type-3 instruction to perform the frame buffer read.

Table 6-19. Type-3 Tx example

Step	Description	R/W	Register [bit]	Value
1	Fill command queue entry-0	W	DSI_CMDQ_0	0x002E0603
2	Set command count	W	DSI_CMDQ_CON	0x1
3	Set memory read continue command	W	DSI_MEM_CONTI[15:0]	0x3E
4	Start command	W	DSI_START [0]	0x1
5	Issue interrupt and receive slave response	R	DSI_INTSTA [0]	0x1
6	Read receive data bytes	R	DSI_RX_DATA03	-
7	Clear interrupt status	W	DSI_INTSTA [0]	0x1
8	Reponse read ack to module and go to next commends in queue	W	DSI_RX_RACK [0]	0x1
9	Issue interrupt and command done	R	DSI_INTSTA [1]	0x1
10	Clear interrupt status	W	DSI_INTSTA [1]	0x1

6.21.5.2.4 Command Mode Status Debug Register

Sometimes an improper configuration settings to DSI, DISP paths and MUTEX may cause hanged issues on DSI because command mode control needs to wait for memory data from DMA in previous stages. As a result, a debugging register DSI_STATE_DBG6 is designed for users to observe internal states of DSI controller in order to reduce debugging efforts. Table 6-20 shows the status mapping to the register bit [14:0]. The user can check the on-hot bit to find incorrect settings.

Table 6-20. Command mode status in debugging register

Bit	Value	Description
0	0x0001	Idle (wait command)
1	0x0002	Reads command queue for packet header
2	0x0004	Sends type-0 command
3	0x0008	Waits for data from the previous module to send type-1 command
4	0x0010	Sends type-1 command
5	0x0020	Sends type-2 command
6	0x0040	Reads command queue for paket data
7	0x0080	Sends type-3 command
8	0x0100	Sends BTA
9	0x0200	Waits for RX-read data
10	0x0400	Waits for software RACK for RX-read data
11	0x0800	Waits for peripheral TE
12	0x1000	Gets TE signaling
13	0x2000	Waits for software RACK for peripheral TE
14	0x4000	Waits for external TE

6.21.5.3 Video Mode

DSI supports video mode traffic sequences, including sync pulse mode, sync event mode and burst mode. To facilitate the translation of the parameters of packets, see the timing diagrams below for the corresponding register settings.

6.21.5.3.1 Sync-Pulse Mode

A non-burst sync-pulse mode enables the peripheral to accurately reconstruct the original video timing, including sync pulse widths. A timing diagram for sync-pulse mode is shown in Figure 6-68, which also shows registers mappings to lines of VSA/VBP/VACT/VFP periods

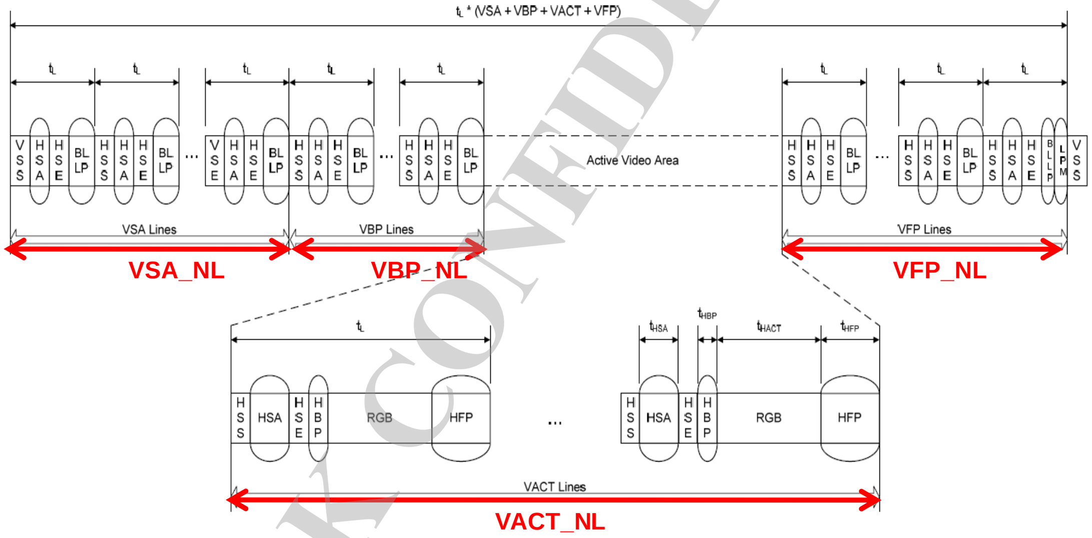

Figure 6-68. Non-burst transmission: sync-pulse mode

A detailed timing diagram for one line period is shown in Figure 6-69. In this diagram, the user must base on real timing parameters of HPW/HBP/HFP and pixel format to figure out the correct value to registers. In addition, a slight adjustment on HFP_WC should also be performed because it needs to leave some space time for HS preparation time due to non-continuous data lane transmission. The formulas for these registers are shown in Figure 6-70.

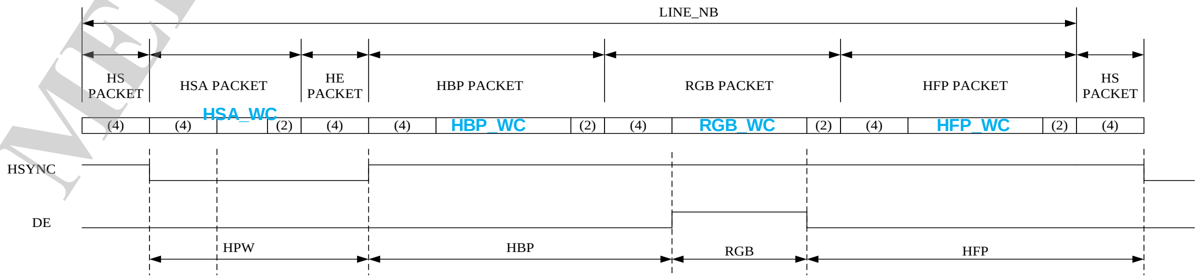

Figure 6-69. Sync-pulse mode line period

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.

- HSA_WC = HPW * BPP - 10
- HBP_WC = HBP * BPP - 10
- RGB_WC = active_pixel * BPP
- HFP_WC = HFP * BPP - 12 - data_init_cycle * lane_num
- data_init_cycle = T_hs-exit + T_lpx + T_hs-prep + T_hs-zero

Figure 6-70. Sync-pulse mode word-count parameters

6.21.5.3.2 Sync-Event Mode

A non-burst sync-event mode is similar to the pulse-sync mode, but accurate reconstruction of sync pulse widths is not required. Therefore, a single sync event is substituted. The timing diagram is shown in Figure 6-71.

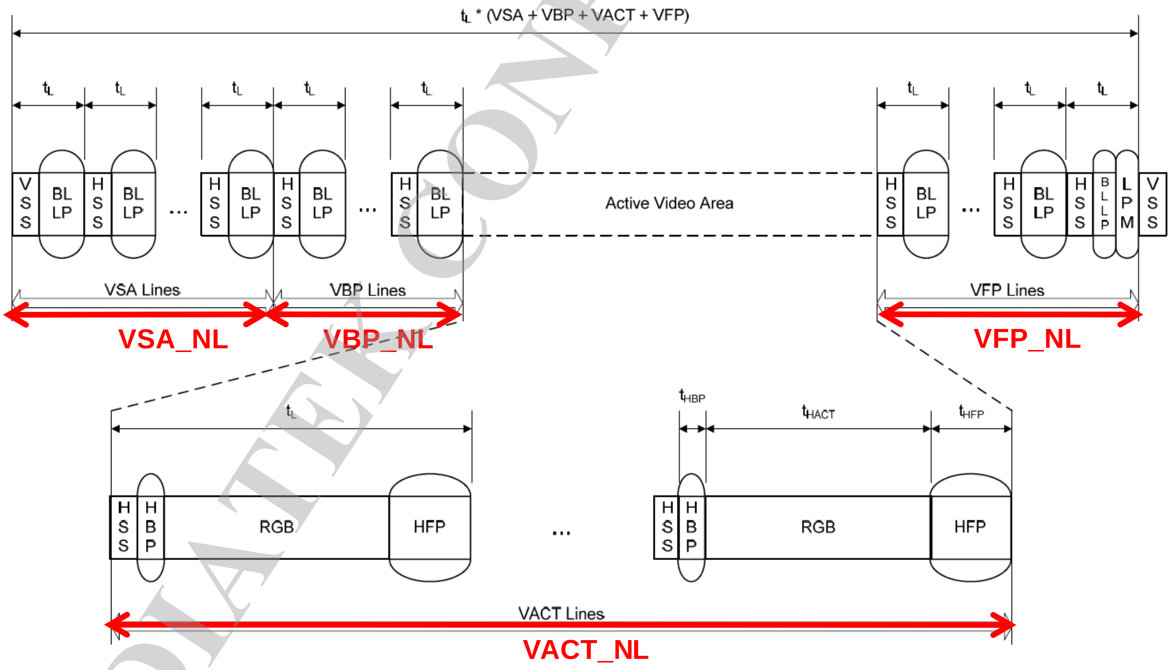

Figure 6-71. Non-burst transmission: Sync-event mode

A detailed timing diagram for one line period is shown in Figure 6-72, and the register settings of word count is listed in Figure 6-73.

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

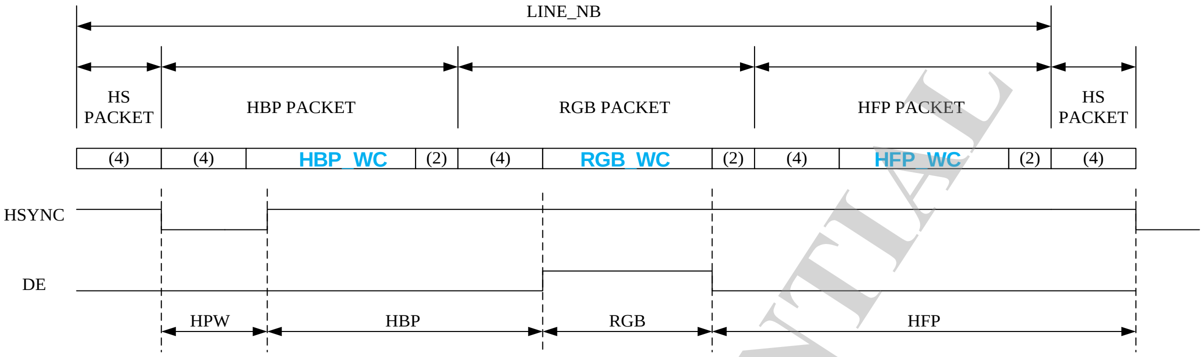

Figure 6-72. Sync-event mode line period

- HSA_WC = don't care
- HBP_WC = (HPW + HPW) * BPP - 10
- RGB_WC = active_pixel * BPP
- BLLP_WC = only set in Burst Mode
- HFP_WC = HFP * BPP - 12 - data_init_cycle * lane_num
- data_init_cycle = T_hs-exit + T_lpx + T_hs-prep + T_hs-zero

Figure 6-73. Sync-event mode word-count parameters

6.21.5.3.3 Burst Mode

The burst mode allows RGB pixel packets to be time-compressed, leaving more time in a scan line for LP mode to save power or for multiplexing other transmissions onto DSI link. The timing diagram is shown in Figure 6-71Figure 6-71.

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

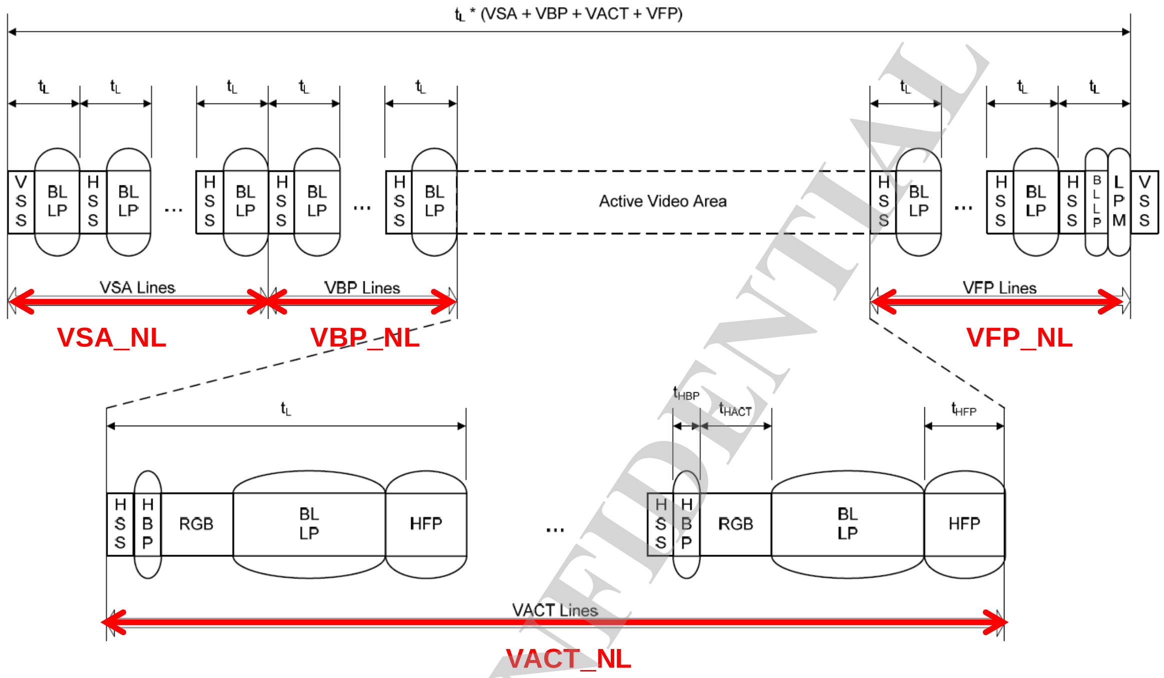

Figure 6-74. Burst mode transmission

Detailed timing diagram for one line period of burst mode is almost the same as sync-event mode shown in Figure 6-72 and Figure 6-73 except that the BLLC_WC register should be set.

6.21.5.4 Clock Lane Non-continuous Low-power Control

Clock lane non-continuous low-power control is supported in the version of DSI, which allows clock lane to return to idle state after a command transmission or during blanking packet period in the video mode. Figure 6-75 shows the blanking packet period distributed in a video mode transmission, where the host transfers blanking packets or back to idle state.

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

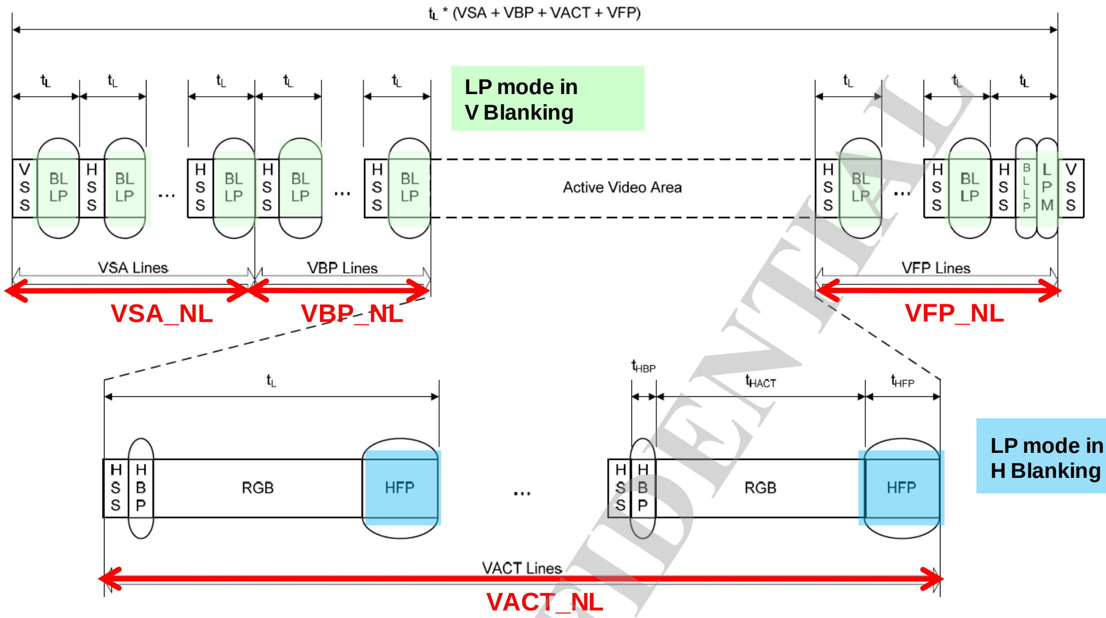

Figure 6-75. Blanking packet in video mode transmission

Figure 6-76 is the timing diagram of vertical blanking low-power control. This mechanism is through the register of DSI_HSTX_CKLP_WC, whose value is listed below. In most cases, vertical blanking power-saving is suggested. If the user would like to have more precise low-power control, the value set for VACT-line horizontal blanking low-power is acceptable. However, the timing should be calculated carefully from affecting the line period since the clock/data lanes need to take time back from idle state to high-speed mode before the next HS transmission.

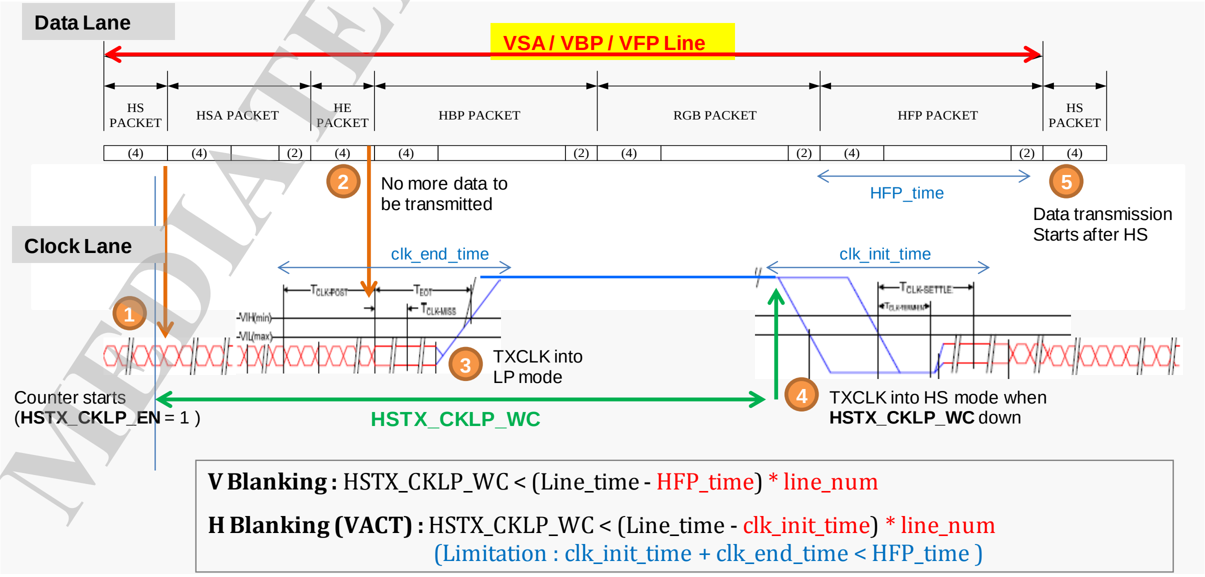

Figure 6-76. Low-power counter settings for video mode low-power control

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

6.21.5.4.1 Auto-calculation for Non-continuous Clock Word Counter

Because the calculation of word counter to control non-continuous clock recover is complicated, to simplify this flow, an auto-calculation register is provided in this version of design. Users can set HSTX_CKLP_WC_AUTO in register DSI_HSTX_CKLP_WC to 1 to allow module to automatically figure out the required values instead of manually calculation. In this mode, the value of HSTX_CKLP_WC is ignored.

6.21.5.5 Peripheral TE Detection

6.21.5.5.1 TE Signaling

DSI is capable of receiving peripheral TE (Tearing Effect) signals via BTA process. Before starting to receive TE signals from the peripheral, make sure a DCS command of "set_tear_on" is sent and register configuration of TE is enabled in the peripheral to avoid TE hang issue. Table 6-21 is an example showing how to trigger TE commands by command queue.

Table 6-21. Example of TE signaling detection

Step	Description	R/W	Register [bit]	Value
1	Fill command queue : DCS "set_tear_on"	W	DSI_CMDQ_0	0x00351500
2	Fill command queue : get TE	W	DSI_CMDQ_1	0x00000020
3	Fill command queue : type-1 command	W	DSI_CMDQ_2	0x002C3909
4	Set command count	W	DSI_CMDQ_CON	0x3
5	Set memory write continue command	W	DSI_MEM_CONTI[15:0]	0x3C
6	Start command	W	DSI_START [0]	0x1
7	Issue interrupt and receive TE	R	DSI_INTSTA [2]	0x1
8	Read trigger status (TE)	R	DSI_RX_TRIG_STA [3:0]	0x2
9	Clear interrupt status	W	DSI_INTSTA [2]	0x1
10	Reponse read ack to module and go to next commends in queue	W	DSI_RX_RACK [0]	0x1
11	Issue interrupt and command done	R	DSI_INTSTA [1]	0x1
12	Clear interrupt status	W	DSI_INTSTA [1]	0x1

6.21.5.5.2 External TE Pin

In certain case we may use external TE pin instead of TE signals for some reasons. DSI supports such mechanism to issue external TE interrupt signals. Refer to the sequences shown in Table 6-22 for detailed control information.

Table 6-22. Example of external TE pin detection

Step	Description	R/W	Register [bit]	Value
1	Enable external TE interrupt	W	DSI_INTEN [4]	0x1
2	Enable external TE	W	DSI_TXRX_CON [10]	0x1

MEDIATEK CONFIDENTIAL

Step	Description	R/W	Register [bit]	Value
3	Select external TE polarity (active-high)	W	DSI_TXRX_CON [9]	0x0
4	Issue interrupt and receive external TE	R	DSI_INTSTA [4]	0x1
5	Clear interrupt status	W	DSI_INTSTA [4]	0x1

6.21.5.6 Video Mode Extra Packet Transmission

DSI supports sending out an extra short/long packet during video mode transmission. This operation must use a set of special registers instead of the original command queue. The single extra packet is sent once and immediately when the user triggers the VM_CMD_START bit of register DSI_START. Refer to the registers with prefix of "DSI_VM_CMD" for more detailed descriptions.

6.21.5.6.1 Short Packet

To transmit an extra short packet in the video mode, follow the example illustrated in Table 6-23.

Table 6-23. Example of short packet transmission in video mode

Step	Description	R/W	Register [bit]	Value
1	Enable vm-cmd function	W	DSI_VM_CMD_CON [0]	0x1
2	Select short packet to be sent	W	DSI_VM_CMD_CON [1]	0x0
3	Enable sending period (VBP, VFP)	W	DSI_VM_CMD_CON [5:3]	0x6
4	Fill short packet ID and bytes 0~1	W	DSI_VM_CMD_CON [31:8]	0x001535
5	Enable vm-cmd done interrupt	W	DSI_INTEN [5]	0x1
6	Start vm-cmd transmission	W	DSI_START [16]	0x1
7	Issue interrupt and vm-cmd transmission done	R	DSI_INTSTA [5]	0x1
8	Clear interrupt status	W	DSI_INTSTA [5]	0x1

6.21.5.6.2 Long Packet

To transmit an extra long packet in the video mode, follow the example illustrated in Table 6-24.

Table 6-24. Example of long packet transmission in video mode

Step	Description	R/W	Register [bit]	Value
1	Enable vm-cmd function	W	DSI_VM_CMD_CON [0]	0x1
2	Select long packet to be sent	W	DSI_VM_CMD_CON [1]	0x1
3	Enable sending period (VSA, VBP, VFP)	W	DSI_VM_CMD_CON [5:3]	0x7
4	Fill long packet ID and word count	W	DSI_VM_CMD_CON [31:8]	0x000739
5	Fill long packet data byte 0~3	W	DSI_VM_CMD_DATA0	0x332211FF
6	Fill long packet data byte 4~6	W	DSI_VM_CMD_DATA1	0x00665544
7	Enable vm-cmd done interrupt	W	DSI_INTEN [5]	0x1
8	Start vm-cmd transmission	W	DSI_START [16]	0x1
9	Issue interrupt and vm-cmd transmission	R	DSI_INTSTA [5]	0x1

6.22 MIPI TX Configuration Module

6.22.1 Introduction

The MIPI TX configuration module, as well as MIPI_TX_Config described in the following sections, is used to control MIPI TX related registers for MIPI DPHY macro. This analog macro includes design of SDM PLL, bandgap, LDO core, lane control, GPI pads, output enable, etc. It provides MIPI DSI high-speed clock up to 1.5Gbps, as well as 768MHz and provides primary clocks to DSI module.

6.22.2 Features

The following functions of MIPI DPHY can be controlled by this module.

- Bandgap control
- LDO core power and configuration
- SDM PLL configuration
- SSC control
- Analog function related settings and status
- Output pads control and electronic features
- GPI pads control
- Software-control mode for each lanes
- Lane swap for clock and data lanes

6.22.3 Register Definition

Module name: mipi_tx_config Base address: (+14017000h)

Address	Name	Width	Register Function

6.22.4 Programming Guide

6.22.4.1 MIPI PLL Initial Sequence

Figure 6-77 illustrates the waveform of the initial sequence to enable power of MIPI DPHY macro and initialize MIPI PLL. The user should follow the steps described in Table 6-23 to perform waveform behavior for MIPI DPHY control. In this example, 520MHz clock is set.

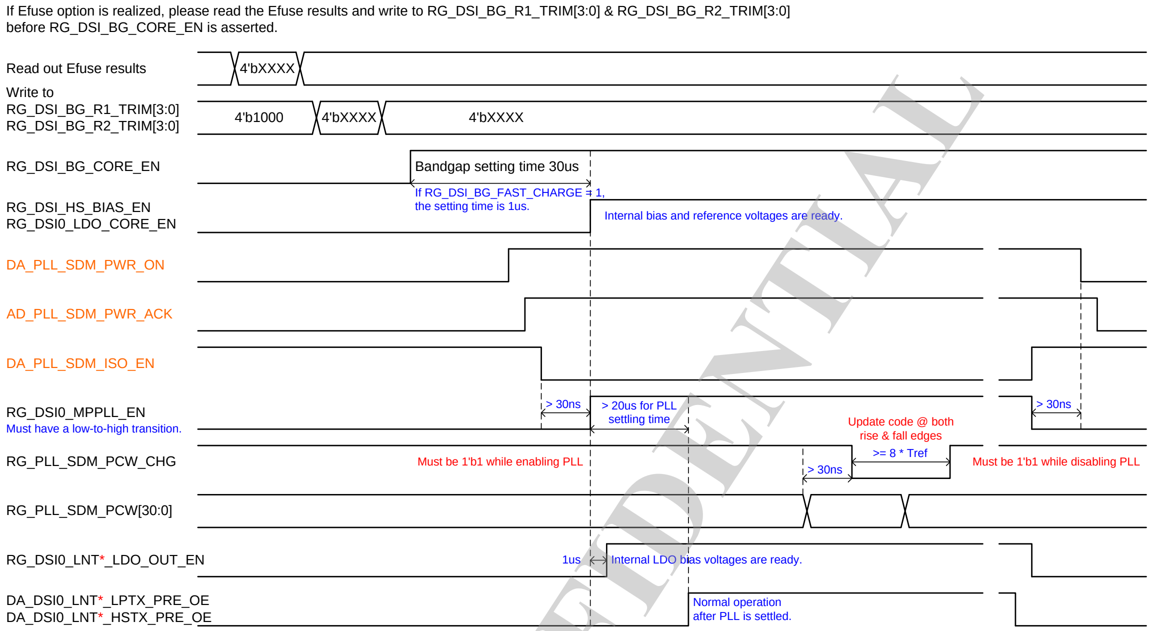

Figure 6-77. Initial waveform of MIPI PLL

Table 6-25. MIPI PLL initial sequence

Step	Description	R/W	Register [bit]	Value
1	Enable 26MHz reference clock	W	AP_PLL_CON0 [6] (0x10209000)	1
2	Enable BG core power and clock	W	DSI_BG_CON [1:0]	3
3	Wait for 30 us	-		
4	Enable HS bias	W	DSI_TOP_CON [1]	1
5	Enable LDO core power and CKG	W	DSI_CON [1:0]	3
6	Enable PLL power	W	DSI_PLL_PWR [0]	1
7	Disable PLL isolation	W	DSI_PLL_PWR [1]	0
8	Set divider control for PLL (no division)	W	DSI_PLL_CON0 [9:1]	0
9	Set SSC control for PLL (no SSC)	W	DSI_PLL_CON1	1
10	Set PLL frequency (512MHz)	W	DSI_PLL_CON2	0x50000000
11	Enable clock lane	W	DSI_CLOCK_LANE [0]	1
12	Enable data lane 0	W	DSI_DATA_LANE_0 [0]	1
13	Enable data lane 1	W	DSI_DATA_LANE_1 [0]	1
14	Enable data lane 2	W	DSI_DATA_LANE_2 [0]	1
15	Enable data lane 3	W	DSI_DATA_LANE_3 [0]	1
16	Enable PLL	W	DSI_PLL_CON0 [0]	1
17	Wait for 20 us	-		
18	Disable pad tie low	W	DSI_TOP_CON [11]	0

6.22.4.2 MIPI PLL De-initial Sequence

For power-off of MIPI PLL for sleep-in or suspend purpose, follow the steps listed in Table 6-26. Be sure to make all registers to default settings to avoid unexpected power consumption.

Table 6-26. MIPI PLL de-initial sequence

Step	Description	R/W	Register [bit]	Value
1	Disable PLL	W	DSI_PLL_CON0 [0]	0
2	Enable pad tie low	W	DSI_TOP_CON [11]	1
3	Disable clock lane	W	DSI_CLOCK_LANE [0]	0
4	Disable data lane 0	W	DSI_DATA_LANE_0 [0]	0
5	Disable data lane 1	W	DSI_DATA_LANE_1 [0]	0
6	Disable data lane 2	W	DSI_DATA_LANE_2 [0]	0
7	Disable data lane 3 (if it exists)	W	DSI_DATA_LANE_3 [0]	0
8	Enable PLL isolation	W	DSI_PLL_PWR [1]	1
9	Disable PLL power	W	DSI_PLL_PWR [0]	0
10	Disable HS bias	W	DSI_TOP_CON [1]	0
11	Disable LDO core power and CG	W	DSI_CON [1:0]	0
12	Disable BG core power and clock	W	DSI_BG_CON [1:0]	0
13	Reset divider control for PLL	W	DSI_PLL_CON0 [9:1]	0
14	Reset SSC control for PLL	W	DSI_PLL_CON1	0
15	Reset PLL frequency (default value)	W	DSI_PLL_CON2	0x50000000
16	Disable 26MHz reference clock	W	AP_PLL_CON0 [6] (0x10209000)	0

6.22.4.3 Suspend/Resume Control

If the system enters suspend mode, DSI module should be operated to enter the ultra-low power state (ULPS) before execution of the sequence shown in Table 6-26. When the system needs to resume from suspend mode, the sequence shown in Table 6-23 should be performed first followed by the ULPS-exit procedure to return the normal output status.

6.22.5 Software Control Mode

The software control mode allows user control output DP/DN pads directly. It is usually used for test or signal measurement. To enable output signals, it needs to setup PRE_OE and OE bits under this mode. Table 6-27 is an example of software control mode operation which sets all output pads to low voltage.

Table 6-27. Software control mode example

Step	Description	R/W	Register [bit]	Value
1	Set up clock lane PRE_OE/OE signal	W	DSI_SW_CTRL_CON0 [1:0]	0x3
2	Set up Data Lane 0 PRE_OE/OE signal	W	DSI_SW_CTRL_CON0 [8:7]	0x3

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL

Step	Description	R/W	Register [bit]	Value
3	Set up Data Lane 1 PRE_OE/OE signal	W	DSI_SW_CTRL_CON0 [15:14]	0x3
4	Set up Data Lane 2 PRE_OE/OE signal	W	DSI_SW_CTRL_CON0 [21:20]	0x3
5	Set up Data Lane 3 PRE_OE/OE signal	W	DSI_SW_CTRL_CON0 [27:26]	0x3
6	Enable software control mode	W	DSI_SW_CTRL_EN	1

6.22.5.1 MIPI PLL SSC

MIPI PLL supports SSC (Spread-Spectrum Control) with fractional précised frequency multiplication. To enable SSC function, the user needs to set up the SSC_EN bit of register DSI_PLL_CON1 and other proper settings. Table 6-28 is an example of initial sequence with SSC for 0 ~ -4% and frequency of 208MHz.

Table 6-28. MIPI PLL initial sequence with SSC enable

Step	Description	R/W	Register [bit]	Value
1	Enable BG core power and clock	W	DSI_BG_CON [1:0]	3
2	Wait for 30 us	-		
3	Enable HS bias	W	DSI_TOP_CON [1]	1
4	Enable LDO core power and CG	W	DSI_CON [1:0]	3
5	Enable PLL power	W	DSI_PLL_PWR [0]	1
6	Disable PLL isolation	W	DSI_PLL_PWR [1]	0
7	Set up TXDIV0 divider (divided by 2)	W	DSI_PLL_CON0 [4:3]	1
8	Set up SSC fraction enable	W	DSI_PLL_CON1 [0]	1
9	Set up SSC phase initial (downward)	W	DSI_PLL_CON1 [1]	1
10	Set up SSC period	W	DSI_PLL_CON1 [31:16]	0x01B1
11	Set up PLL frequency	W	DSI_PLL_CON2	0x40000000
12	Set up SSC amplitude	W	DSI_PLL_CON3	0x07900790
13	Enable clock lane	W	DSI_CLOCK_LANE [0]	1
14	Enable Data Lane 0	W	DSI_DATA_LANE_0 [0]	1
15	Enable Data Lane 1	W	DSI_DATA_LANE_1 [0]	1
16	Enable Data Lane 2	W	DSI_DATA_LANE_2 [0]	1
17	Enable Data Lane 3	W	DSI_DATA_LANE_3 [0]	1
18	Enable PLL	W	DSI_PLL_CON0 [0]	1
19	Wait for 20 us	-		
20	Enable SSC	W	DSI_PLL_CON1 [2]	1
21	Disable pad tie low	W	DSI_TOP_CON [11]	0

6.23 JPEG Encoder

6.23.1 Introduction

The hardware JPEG encoder implements the baseline mode of Standard ISO/IEC 10918-1. After initialization by software, the hardware JPEG encoder can generate the entire compressed file. Figure 6-78 shows the procedure of the JPEG encoder. The YUV pixel data are retrieved from the memory and grouped into 8x8 blocks. YUV422 one plane and YUV420 two plane formats are supported. When encoding, the first thing to do is turning the pixel data into the frequency domain using FDCT. After the quantization is done, the quantized DCT coefficients are encoded by RLE and VLC. Then the bitstream of JPEG file is generated.

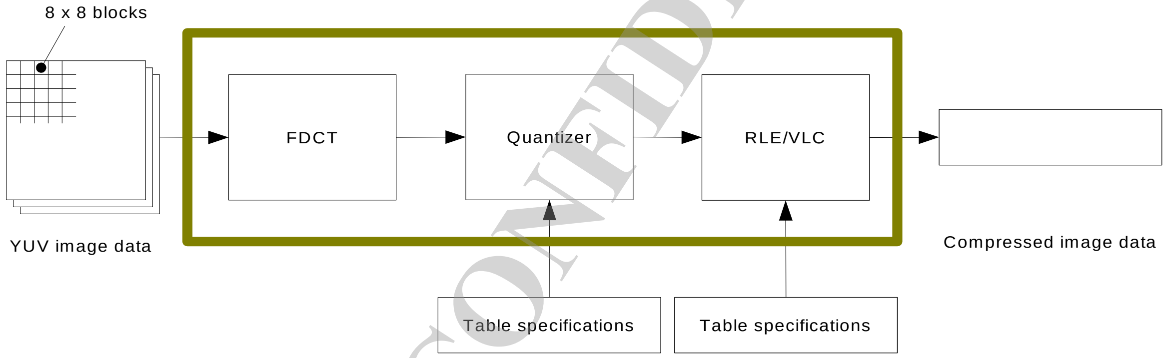

Figure 6-78. Procedure of JPEG encoder

6.23.2 Features

The JPEG encoder supports YUV 422 and 420 formats for color pictures. With software assistance and suitable destination memory address setting; JFIF/EXIF JPEG format can also be supported. For hardware reduction, it uses standard DC and AC Huffman tables for both luminance and chrominance components. To adjust the picture compression ratio and picture quality, there are 15 levels of quantization that can be programmed.

6.23.2.1 Software Reset Mechanism

To avoid problem occurred with wrong SMI protocol, the software should do reset based on the following procedure.

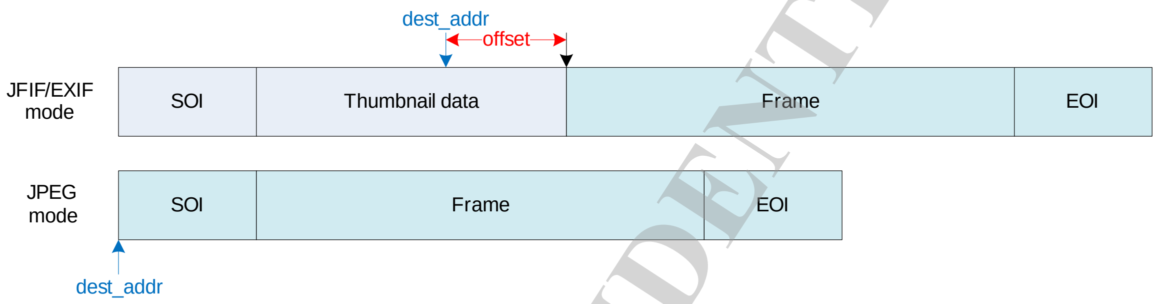
1. The EN bit in JPGENC_CTL should be set to 0.
2. The software polls the GMC_IDLE bit in JPGENC_DEBUG_INFO0.

Only when the GMC_IDLE bit is 1 can the RSTB bit in JPGENC_RST be set to 0 to do the reset scheme. Be sure to follow this procedure to do software reset.

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

6.23.2.2 Byte Offset Address Setting

To align SMI bus bitwidth, the buffer address should be 16-bytes aligned. However, to reduce software bitstream copy and concatenate effort, software can program a byte offset setting (from 0~15 bytes) to offset the start position of bitstream written out by hardware. The illustration of this feature is as the following.



- Example: If SOI starts at 0x0000,
  - JFIF/EXIF mode: SOI+thumbnail data length = 50 bytes
    - dest_addr = 0x0030
      offset = 0x0002

6.23.3 DRAM Buffer Requirement

- Source frame buffer
  - YUV422:
    - One frame buffer
    - Buffer size
      - {[(width_y*2) + 127]/128}*128*[(height_y + 7)/8]*8
  - YUV420: Two frame buffers
    - Two frame buffers
    - Buffer size
      - Y: [(width_y + 127)/128]*128*[(height_y + 15)/16]*16
      - UV: [(width_y + 127)/128]*128*[(height_y + 7)/8]*8
- Bitstream buffer
  - One buffer
  - Buffer size (suggested)
    - YUV422: width_y* height_y * 2
    - YUV420: width_y* height_y * 1.5
    - Must be multiple of 128 bytes.

Bit(s)	Name	Description
31:0	DMA_ADDR0	**JPEG encoder current written address setting 0** This address information will be updated after every one burst write command is finished.

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

17003128 **JPGENC_STALL_ADDR0** **JPEG Encoder Stall Address 0 Register** **000000F0**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	STALL_ADDR0[27:12]															
Type	RW															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	STALL_ADDR0[11:0]															
Type	RW															
Reset	0	0	0	0	0	0	0	0	1	1	1	1				

Bit(s)	Name	Description
31:4	STALL_ADDR0	**JPEG encoder stall address setting 0** The stall address must be 16-byte aligned and should be set to bigger than the actual upper bound by one burst command (128 bytes). Whenever the stall address is reached, the JPEG encoder stalls and issues an interrupt to software. The software can discard the incomplete file by simply resetting the JPEG encoder to cancel the encoding operation. It is also essential that the value of JPGENC_STALL_ADDR should be bigger than JPGENC_DEST_ADDR by at least 624 bytes to guarantee the header of the JPEG file can be completely written into memory. *Note: JPG_ENC_STALL_ADDR should not be set to smaller than JPG_ENC_DEST_ADDR; otherwise stall condition will occur.*

17003138 **JPGENC_OFFSET_ADDR** **JPEG Encoder Offset Address Register** **00000000**

6.24 JPEG Decoder

6.24.1 Introduction

At present most images must be stored as JPEG format compressed files. In order to display this kind of files and boost image processing performance, the hardware JPEG decoder is developed. The JPEG decoder is designed to decode baseline JPEG file with general YUV sampling combinations. (Note that the progressive decoding is NOT supported in the hardware decoder).

To obtain the best speed performance, the JPEG decoder handles all portions of JPEG files except for the 17-byte SOF marker. The software only needs to program related control registers based on the SOF marker and wait for an interrupt coming from the hardware. Figure 6-80 is the basic JPEG file structure and the start address that JPEG decoder needs. The information of DQT and DHT table is included in the JPEG file, which should be parsed by the JPEG decoder and stored in the memory.

Taking into consideration the limited size of memories, the hardware decoder also supports breakpoints insertion in huge JPEG files. Breakpoints insertion allows software to load partial JPEG file from the external flash into the internal memory if the JPEG file is too large to sit internally at a time.

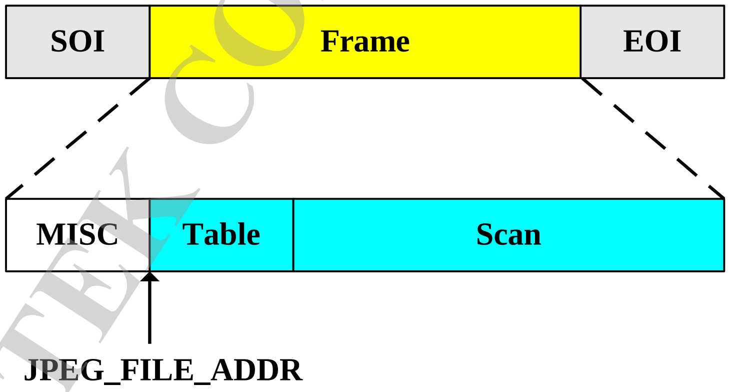

Figure 6-80. Basic structure of JPEG files

6.24.2 Features

The sleep controller receives commands from system software and controls the built-in power management unit to cut off the power supply of the external clock source. The power of external clock source can be resumed by several events predefined by users. These events are issued by:

- Baseline JPEG decoding (no progressive decoding, no restart marker decoding, bypassed to software solution)
- Sampling format limitation: See Figure 6-81.
- Hardware table parsing (SW handles SOF parsing.)
- Supports file breakpoint
- 1/2/4/8 block resize (some limitation due to format conversion; see 6.24.2.3 “Block Resizing”)
- Supports MCU rows pause/resume

Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

- Error handling by bitstream overflow detection
  The supported input sampling format of JPEG decoder is illustrated in Figure 1-2

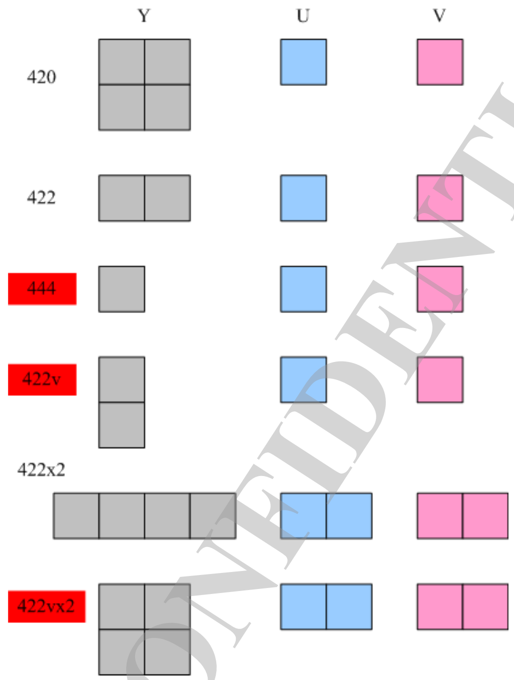

Figure 6-81. Supported sampling format of input JPEG file

For input sampling format that is not supported by the hardware, software solutions are adopted.

6.24.2.1 Software Reset Mechanism

To avoid unexpected memory access behavior, the soft reset scheme is also developed for JPEG decoder (same procedure as JPEG encoder). First, assert the soft reset bit in JPGDEC_RESET. Then hardware issues a done interrupt when its state is not busy. Software de-asserts the soft reset bit and clears the interrupt status. Finally, assert the hard reset bit in JPGDEC_RESET to do the reset process.

To reset JPEG decoder and GDMA in the direct couple mode, perform soft reset mechanism to JPEG decoder and reset JPEG decoder first. Then perform GDMA soft reset mechanism to reset GDMA.

6.24.2.2 Operation Modes

6.24.2.2.1 Normal Mode (Full Frame Mode)

In normal mode, JPEG decoder will output full frame to DRAM. Next, ISP/MDP takes over to resize and do image processing. For software usage, one set of frame buffer should be allocated to JPEG decoder and set up the corresponding configuration to trigger hardware for decoding. JPEG decoder will return interrupt when full frame is decoded.

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL

6.24.2.2.2 Pause/Resume Mode

In pause/resume mode, JPEG decoder outputs multiple MCU rows to DRAM based on software configuration and pause. JPEG decoder returns interrupt when the assigned MCU rows are decoded. The next configuration and trigger resume JPEG decoder, and the following MCU rows are outputted correspondingly. For software usage, one set of MCU rows buffer should be allocated to JPEG decoder. When JPEG decoder finishes the assigned MCU rows and pause, software should do the next configuration and trigger hardware until full frame is decoded. JPEG decoder will return interrupt when full frame is decoded.

6.24.2.3 Block Resizing

To save memory usage for JPEG image with extreme large size, block level resizing is supported by JPEG decoder. Simple 1/2, 1/4, 1/8 block level resize using 2-tap bilinear filter is adopted.

Since sampling format conversion is needed for JPEG decoder. Resize limitation exists for some source formats (e.g. for YUV444 input, only 1/4 resize can be performed).

		Config			
src format	dst format (3/1-plane)	Y_rsz	UV_h_rsz	UV_v_rsz	Limitation on real rsz
420	420	real_rsz	real_rsz	real_rsz	No
422	422	real_rsz	real_rsz	real_rsz	No
444	422	real_rsz	1+real_rsz	real_rsz	~ 1/4
422v	420	real_rsz	1+real_rsz	real_rsz	~ 1/4
422 x 2	422	real_rsz	real_rsz	real_rsz	No
422v x 2	420	real_rsz	1+real_rsz	real_rsz	~ 1/4

6.24.2.4 Error Handling Mechanism

Error handling is first performed in software header parsing stage. If the header is corrupted, software should not pass such file to hardware decoder. In hardware decoding stage, only part of error detection is supported (no error concealment capability). Several types of detection are supported, including invalid Huffman entry and block overflow. One flag will be raised when such error is detected and error interrupt will be issued. Hardware stops when 0xffd9 is encountered or the file size count is reached. If software is to stop JPEG decoder when error is detected, use the soft reset scheme.

6.24.3 DRAM Buffer Requirement

For JPEG decoder, two types of buffers should be allocated by software, bitstream buffer and decoded frame buffer.

The bitstream buffer is used to store the jpeg file bitstream. The start address should be 16-byte aligned, and the address position should be the first marker segment (such as DQT or DHT) after all

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

the APP markers are skipped. The break point address can be set based on the limited memory size. The related control register is JPEG_FILE_ADDR and JPEG_FILE_BRP. The allocated bitstream buffer size should be multiple of 128 bytes.

The decoded frame buffer is separate 3-plane planar format and the supported color format is YUV422, YUV420 and grayscale Figure 6-82 is an example of the decoded frame buffer.

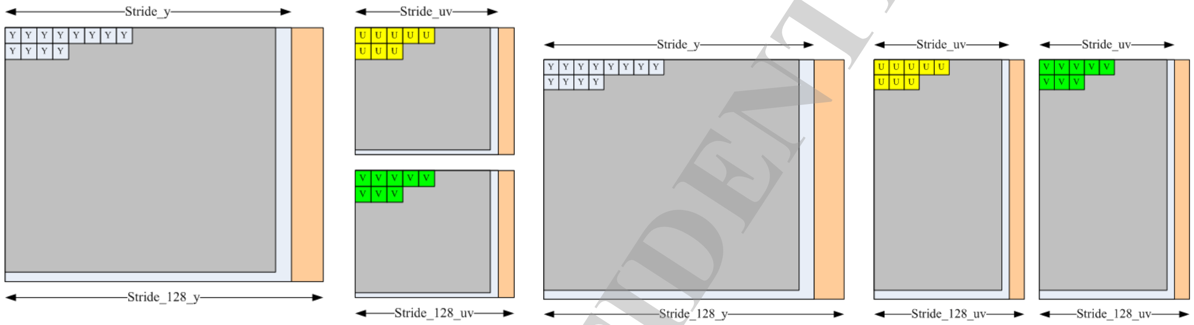

Figure 6-82. Memory footprint of source frame buffer

- Bitstream buffer
  - One buffer
  - Buffer size: Depends on available memory buffer
    - **Must be multiple of 128 bytes**
    - Loading as many as possible for better decoding performance is recommended.
    - Supports breakpoint feature
- Destination frame buffer
  - YUV422:
    - Three frame buffers
    - Buffer size
      - Y: [(width_y + 127)/128)]***128***[(height_y + 7)/8)]*8
      - U: [(width_u + 127)/128]***128***[(height_y + 7)/8]*8
      - V: [(width_v + 127)/128]***128***[(height_y + 7)/8)]*8
  - YUV420:
    - Three frame buffers
    - Buffer size
      - Y: [(width_y + 127)/128]***128***[(height_y + 15)/16]*16
      - U: [(width_u + 127)/128]***128***[(height_y + 7)/8]*8
      - V: [(width_v + 127)/128]***128***[(height_y + 7)/8]*8

Name	FILE_ADDR[27:12]															
Type	RW															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	FILE_ADDR[11:0]															
Type	RW															
Reset	0	0	0	0	0	0	0	0	0	0	0	0				

Bit(s)	Name	Description
31:4	FILE_ADDR	**JPEG file starting address** This address must be 16-byte aligned. This register's content will be changed by hardware if JPEG decoder is started. The contents represent the address read. It is suggested the starting address be set to the location of DQT marker (0xffdb) at the beginning of decoding one JPEG file. Some dummy data (0xff) can be inserted before the JPEG file to help meet the limitation of 16-byte alignment. When enabling the function of breakpoint, one JPEG file can be divided into several sections and loaded to the memory for decoding individually. In every end of a section, the software needs to re-program this file address to the start address of the next file section. Any dummy data are not allowed to be inserted in the file content. *Note: Due to DCM implementation, this register can be read only if DCM is disabled.*

1700420C **JPGDEC_COMP_ID** **JPEG Decoder Component ID Register** **00000000**

Name	JPEG_FILE_BRP_ADDR[13:0]															
Type	RW															
Reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1		

Bit(s)	Name	Description

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Name	Description
31:2	JPEG_FILE_BRP_ADDR	**JPGDEC_FILE_BRP stands for 16-byte aligned breakpoint address that hardware will stall once the breakpoint address is encountered.** The data in the current breakpoint address will not be parsed for decoding. This control register provides a solution for software to swap internal memory content with the external memory in case the JPEG source file is too big for the internal memory to store at a time. A breakpoint interrupt will be fired when the hardware DMA address hits the breakpoint address. The software can refill the residue bitstream and follow the procedure below to restart the JPEG decoder. 1. Write new breakpoint address to JPGDEC_FILE_BRP register. 2. Write new destination address to JPEG_DEC_FILE_ADDR register. 3. Write JPG_DEC_TRIG register to trigger the decoder.

1700424C	**JPGDEC_FILE_TOTAL_SIZE**	**JPEG Decoder File Size Register**	**FFFFFFFC**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Name	**JPEG_FILE_TOTAL_SIZE[13:0]**															
Type	RW															
Reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1		

Bit(s)	Name	Description
31:2	JPEG_FILE_TOTAL_SIZE	**Size slightly larger than the JPEG source file size in bytes for error file detection** The hardware will fire a file overflow interrupt and stall if this size of bitstream has been read in. *Note: The total size of file must be a multiple of 128 (including initial dummy data). If the total size is not divisible by 128, increase the size value until it is.*

17004270	**JPGDEC_QT_ID**	**JPEG Decoder Quantization Table ID Register**	**00000011**

6.25 Video Decoder

6.25.1 Introduction

MediaTek Video Decoder (VDEC) in project MT6735 supports multi-standard video compression format, which greatly reduces the CPU loading and achieves high performance video decompression.

The video standard supported by VDEC includes:

- MPEG1/2
- H.264 CBP/MP/HP
- MPEG4 ASP
- DIVX3/DIVX4/DIVX5/DIVX6/DIVX HD/XVID
- Sorenson H.263, H.263
- De-Blocking Filter for MPEG2, H.263
- H.264 decoder Constraint Baseline Profile/Main/High Profile

VDEC supports full-HD 30fps under the limitation of picture size > full-HD, (i.e. does not support picture width > 1920 or picture height > 1088).

6.25.2 Block Diagram

The architecture and core blocks of VDEC are shown in Figure 6-83, including the following parts: Entropy Decoder, IS/IQ/IT, MV Calculation, Intra Prediction, Motion Compensation and De-blocking Filter. The input to VDEC is a compressed video bitstream. After the decoding process, the reconstructed video will be sent to the display stage.

6.25.2.1 Interface

The interface of VDEC is shown in Figure 6-84. Related modules include SMI interface, APB interface and handshaking bus between VDEC and CDP. The output format supported by VDEC is:

- NV12_BLK (Video block mode), 420 format block mode, 2 plane (UV)
- NV12_BLK_FCM (Video field compact mode), 420 format block mode, 2 plane (UV)

VDEC use DRAM as bitstream input, working buffer, reference buffer and output, and DRAM access process is achieved by using SMI interface. 7 sets of SMI interface with 128 bits read/write are used including MC/PP/PP_WRAP/AVC_MV/PRED_RD/PRED_WR/VLD. In addition, all ports are EMI ports, i.e. no SYSRAM required.

Register settings are passed to VDEC by APB interface. There are 1 set of APB interface.

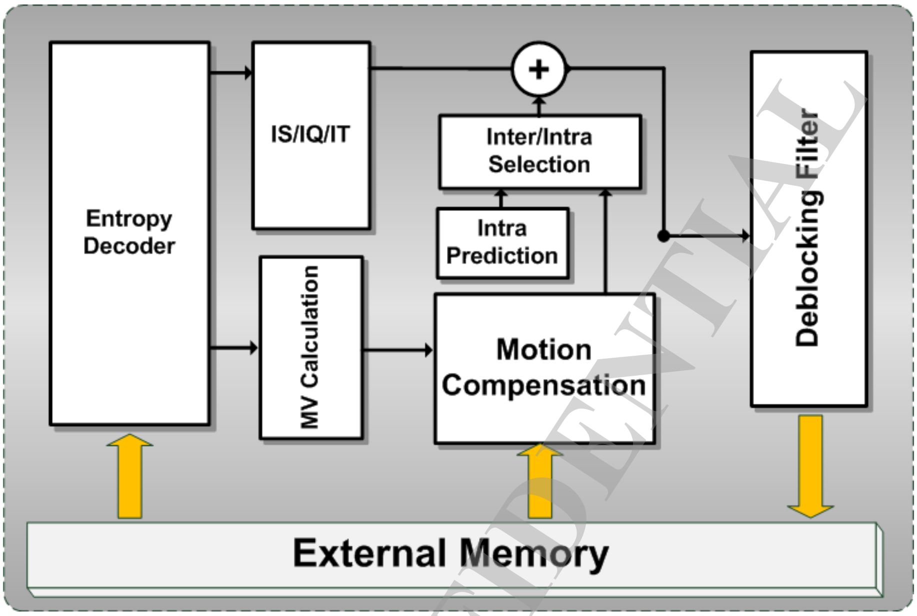

Figure 6-83. Block diagram of video decoder

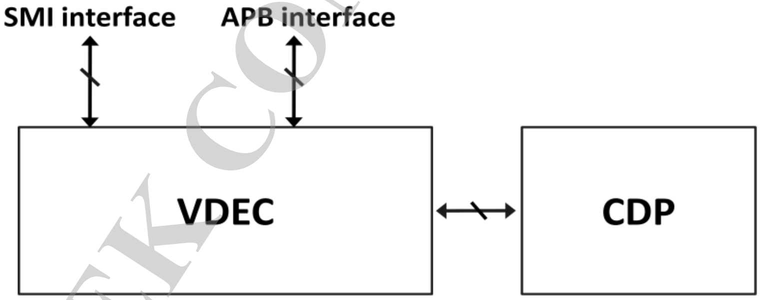

Figure 6-84. Interface of VDEC

6.25.3 Programming Guide

This section defines the recommended programming procedure for using VDEC to perform video decompression correctly. Moreover, this section also introduces common functions and settings, that is, these functions do not change under different video coding standards.

6.25.3.1 Base Settings

This section describes useful settings before programming VDEC, including clocks and base address of VDEC.

6.25.3.1.1 Clocks

Two clocks are required for VDEC.

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

- smi_clk: 300MHz
- vdec_clk: 273MHz

For more details, see the CKGEN register map.

6.25.3.1.2 VDEC Register Base Address

Base address of each sub-module is described in Table 6-29.

Table 6-29. VDEC base address

CS	BASE (hex)	HW cs	comment
VDEC_MISC	0x16020000	cs_vdec_dv	Legacy naming is DV_BASE
VLD	0x16021000	cs_vdec_vld	
VLD_TOP	0x16021800	cs_vdec_vld	Partial bank of VLD_BASE, i.e. (VLD | 0x800)
MC	0x16022000	cs_vdec_mc	
AVC_VLD	0x16023000	cs_avc_vld	
AVC_MV	0x16024000	cs_avc_mv	
PP	0x16025000	cs_vdec_pp	
VDEC_GCON	0x16000000		VDEC global control registers
SMI_LARB1	0x16010000		SMI Larb1 control registers

6.25.3.2 VDEC Hardware Architecture

Figure 6-85 is the hardware architecture; Figure 6-86 is the detail architecture of VLD. It is essential to know the architecture of VLD because most common settings are related to this module.

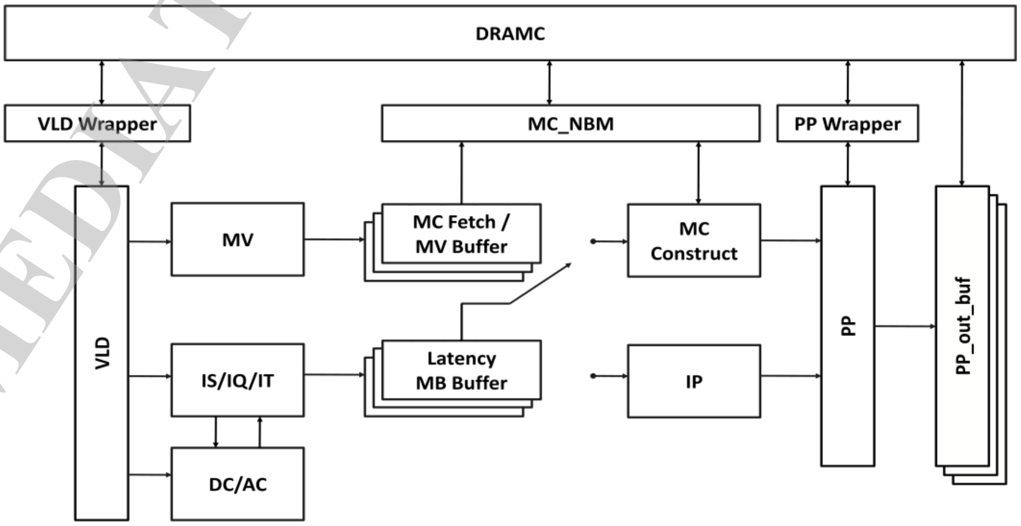

Figure 6-85. VDEC hardware architecture

MEDIATEK CONFIDENTIAL

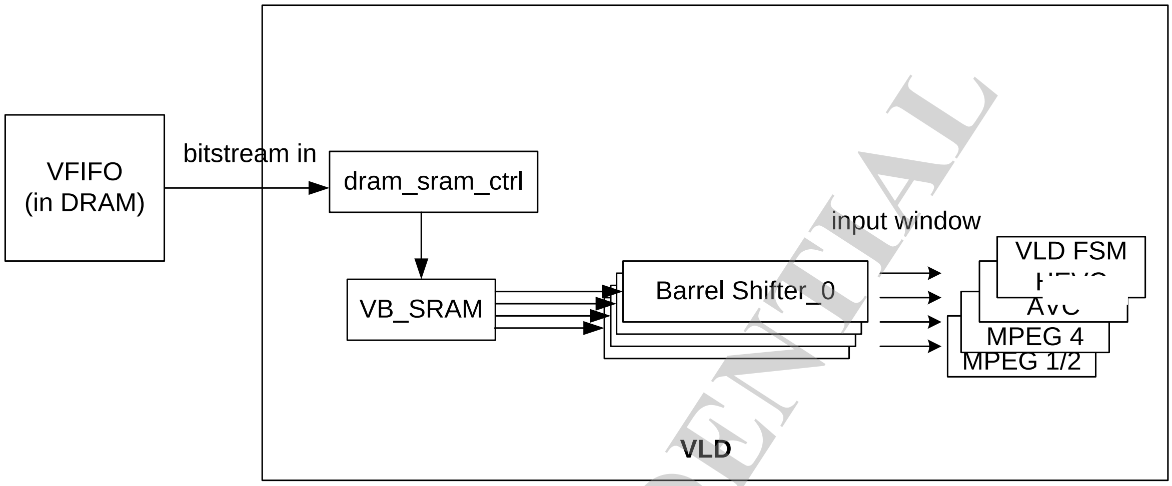

Figure 6-86. VLD hardware architecture

6.25.3.3 Firmware Hardware Partition

Figure 6-87 shows a typical decoding flow with FW/HW partition. SW takes charge of the frame level setting, including syntax decoded from frame header and proper DRAM buffer allocation, and triggers HW to decode the bitstream. An interrupt signal will be sent to CPU when HW finishes decoding a frame and FW can reset HW and program settings for the next frame if necessary. Details of FW decoding are described in section 6.25.3.4.

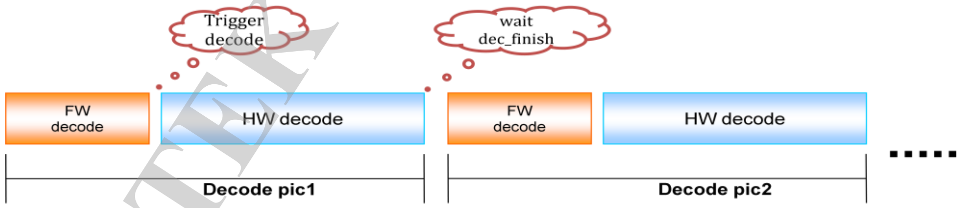

Figure 6-87. VDEC decoding flow

6.25.3.4 FW Decoding Flow

This section describes our recommended step-by-step FW setup flow. Each step should be followed to ensure a correct decoding process.

1. Soft reset
   a. Issue reset vld_reg_66[0] = 1.
   b. Turn on VDEC related clocks.
   c. Release soft reset vld_reg_66[0] = 0.
2. Initial Bitstream DMAs and Barrel-Shifters.
3. Decode frame layer syntax.
4. Maintain DPB buffer.

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

5. HW registers setting
    a. SQT setting
    b. MV setting
    c. MC setting
    d. De-blocking (PP) setting
    e. VLD setting
6. Trigger HW decoding.
7. Wait for decoding picture to finish via VDEC interrupt (HW auto turns off VDEC related clocks).

6.25.3.4.1 Software Reset and Power Control Flow

Figure 6-88 is the software reset and power control flow. Details of each step are described in the following sections.

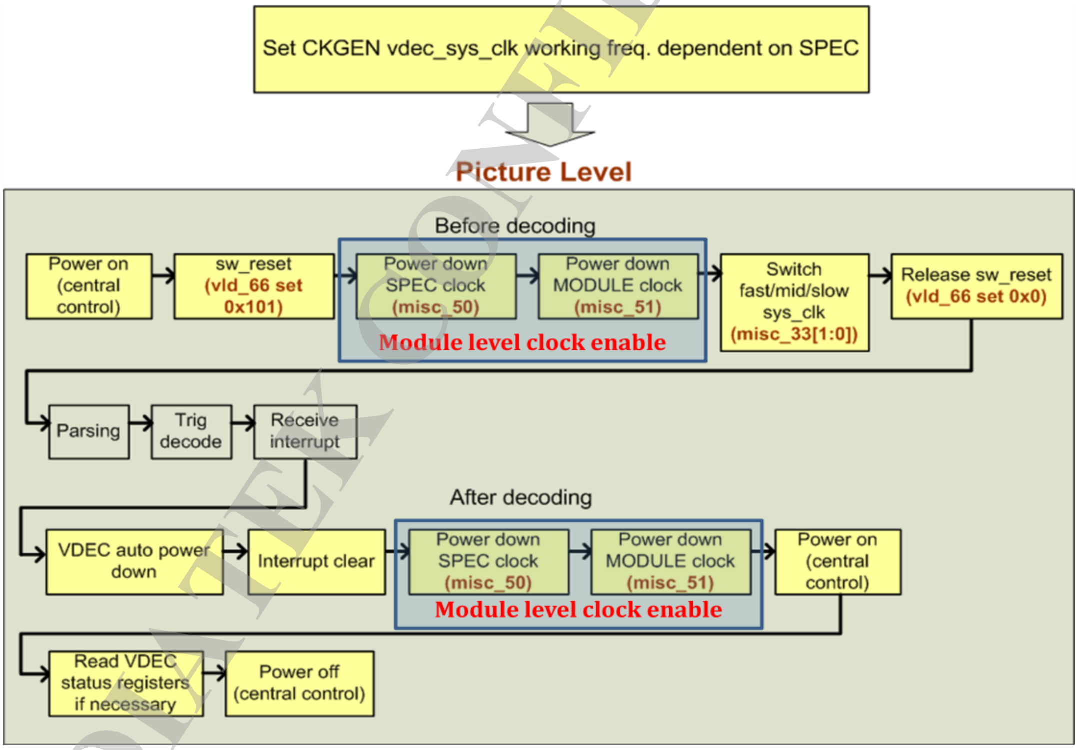

Figure 6-88. Software reset and power control

- ✓ Power on (central control)
    - Set VDEC_GCON reg 0 bit[0] (vdec subsys clock enable) = 1.
    - Enable global clocks of VDEC (DRAM clock, vdec_sys clock, bus clock).
- ✓ VDEC auto power-down
    - Auto turn off DRAM clock, vdec_sys clock.
    - Auto set pdn_con_spec (vdec_misc_reg 50) = 32'hffffffff.
    - Auto set pdn_con_module (vdec_misc_reg 51) = 32'hffffffff.
- ✓ Interrupt clear
    - No interrupt clear from CPU

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

- Use internal VDEC RISC clear int
  - VDEC_MISC reg 41
    - Bit [0] (risc_clr_int_mode) always set to 1
    - Bit [4] (risc_int_clr): Internal VDEC RISC clear int

✓ Power off (central control)
  - Set VDEC_GCON reg 0 bit[0] (vdec subsys clock enable) = 0

6.25.3.4.2 Turn off VDEC Auto Power Down

FW can turn off VDEC auto power down by disabling the setting of "auto turn off dram clk, vdec sys clock" and disabling "Auto set pdn_con_spec = 32'hffffffff & Auto set pdn_con_module = 32'hffffffff".

Related register settings are:

- Disable "Auto turn off dram clock, vdec_sys clock"
  - Set VDEC_GCON reg 6 bit[0] = 1
- Disable "Auto set pdn_con_spec = 32'hffffffff & Auto set pdn_con_module = 32'hffffffff"
  - Set VDEC_MISC reg 59 bit[0] = 1

The decoding process will change after FW turns off VDEC auto power-down control. The difference is shown Figure 6-89.

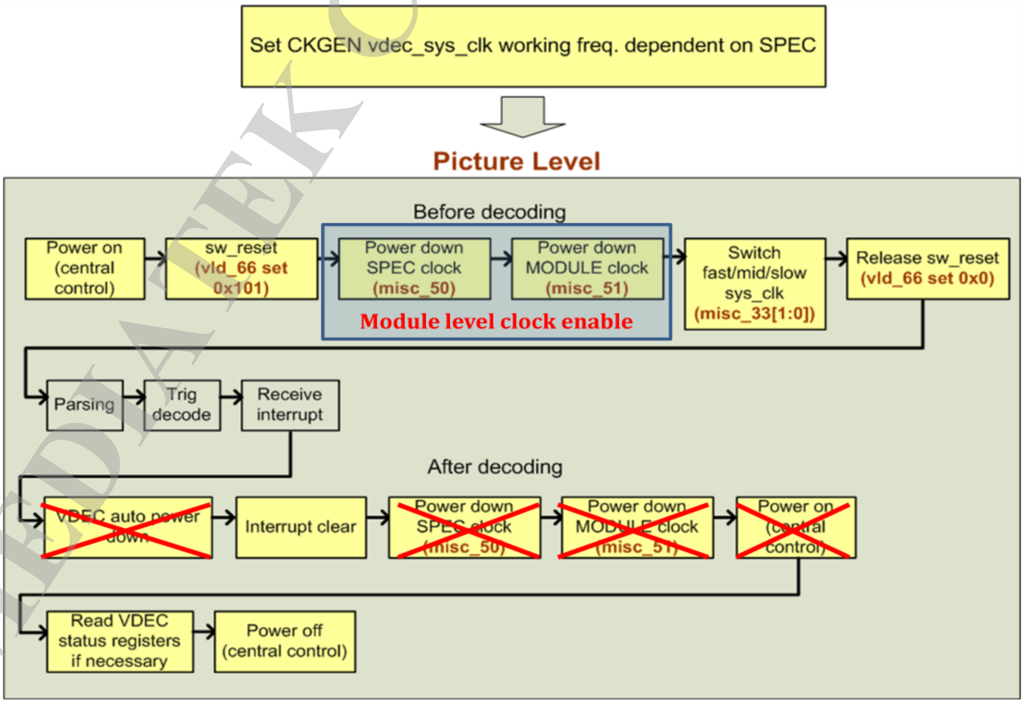

Figure 6-89. Software reset and power control (turn off VDEC auto power down)

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL

6.25.3.4.3 Other Relative Registers for Power Control

FW can disable "Auto turn off dram clock, vdec_sys clock" when dec_error occurs by setting VDEC_GCON reg 6 bit[4] = 1.In addition, when dec_error occurs, there is **always no** "Auto set pdn_con_spec = 32'hffffffff & Auto set pdn_con_module = 32'hffffffff".

6.25.3.4.4 Clock and Power Down Setting

a. Enable global clocks of VDEC (DRAM clock, vdec_sys clock, bus clock).
   i. Set VDEC_GCON reg 0 bit[0] (vdec subsys clock enable) = 1.
b. Enable SRAMs of SMI/VDEC.
   i. ***SLEEP_IFR_PWR_CON = (***SLEEP_IFR_PWR_CON&0xffff00ff);
   ii. ***SLEEP_VDE_PWR_CON = (***SLEEP_IFR_PWR_CON&0xffff00ff);
c. Set up clock gating for each standard and modules.
   i. Software reset: Set VLD reg 66 = 0x101.
   ii. Set up **pdn_con_spec** & **pdn_con_module** setting for different specs.
      1. **pdn_con_spec (VDEC_MISC reg 50 (0xC8))**
         A) **pdn_con_module (VDEC_MISC reg 51 (0xCC))**
   iii. Set up vdec_sys_clk_sel for different specs:
      1. **vdec_sys_clk_sel (VDEC_MISC reg 33(0x84))**
   iv. Release software reset: reset VLD reg 66 = 0x0

VDEC system clock frequent, as well as Module level power down control, depend on different specs. Details are described in Table 6-30.

Table 6-30. Power down control and clock selection

SPEC	VDEC_MISC reg 50 (0xC8) pdn_con_spec (set 1: turn off clock)	VDEC_MISC reg 51 (0xCC) pdn_con_module (set 1: turn off clock)	VDEC_MISC reg 33(0x84) vdec_sys_clk_sel (0 = Slow; 1 = Mid; 2 = Fast)
MPEG1_2	0x1FE	0x7F6A_15FD (w/o DBK) 0x7F6A_151D (w DBK)	0x1 (mid)
MPEG4	0x1FD	0x7F6A_11E8 (w/o DBK) 0x7F6A_1108 (w DBK)	0x1 (mid)
H.264/MVC	0x1F7	0x53E2_0180	0x2 (fast)

6.25.3.4.5 Interrupt Clear

In MT6735, there is no interrupt clear from CPU, i.e. interrupt clear should be achieved by FW setting up internal VDEC RISC. To perform interrupt clear, set up the following:

VDEC_MISC reg 41
- Bit [0] (risc_clr_int_mode) always set to 1
- Bit [4] (risc_int_clr): Internal VDEC RISC clear int

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

6.25.3.5 Initial Bitstream DMAs and Barrel-Shifters

Before triggering HW VDEC to decode a picture, load bitstream from DRAM to VDEC internal memory and set up correct read location of bitstream. These steps are known as the initial fetch and initial barrel-shifters. The concept is described in Figure 6-90, and the flow chart is in Figure 6-91.

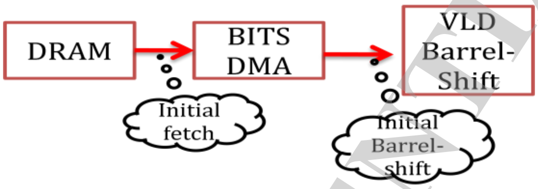

Figure 6-90. Initial fetch and initial Barrel-shift

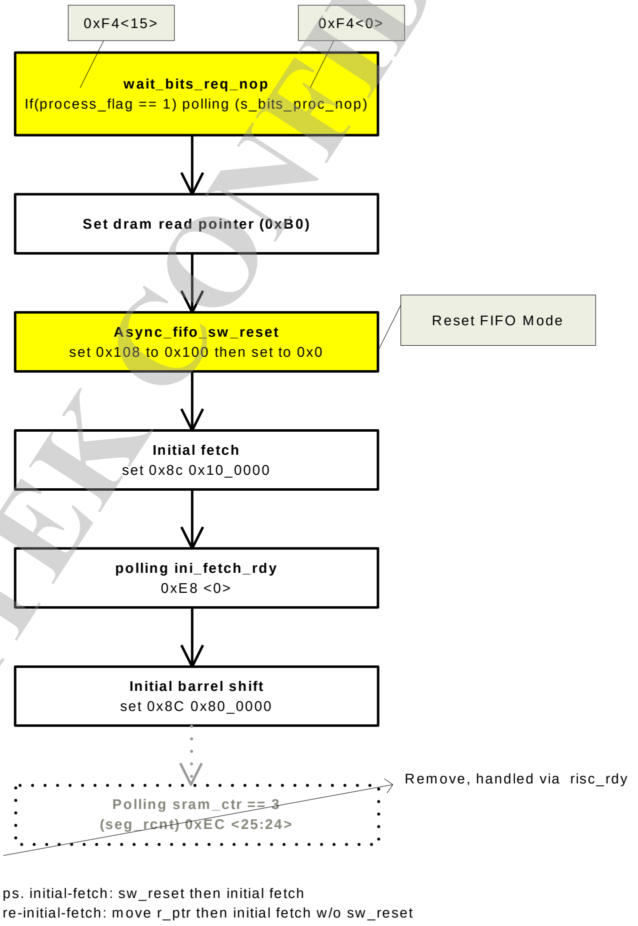

Figure 6-91. Flow chart of initial fetch and initial Barrel-shift

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL

6.25.3.5.1 Bitstream FIFO (vb SRAM)

After initial fetch, the bitstream will be loaded in to bitstream FIFO (vb SRAM). When the amount of empty data is less than the threshold, the engine will auto fetch bitstream from DRAM to bitstream FIFO (see Figure 6-92).

- Read pointer of bitstream buffer: vb_sram_ra (0x0EC VB_SRAM_RA<4:0>)
- Write pointer of bitstream buffer: vb_sram_wa (0x0EC VB_SRAM_WA<12:8>)
- Read counter for each 128-bit data: seg_rcnt (0x0EC SEG_RCNT<25:24>)

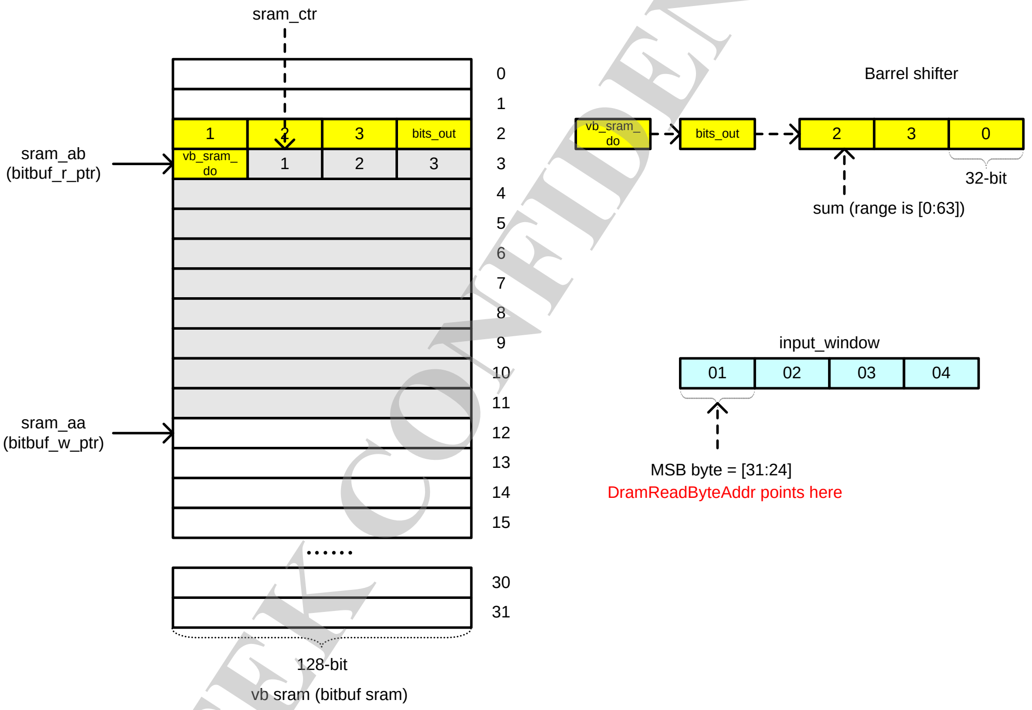

Figure 6-92. Block diagram of bitstream buffer and barrel shifter

When vb_sram_ra points to row 3 and seg_rcnt value is 1, the barrel shifter content is {row2{2}, row2{3}, row3{0}}.

6.25.3.5.2 Barrel Shifter

The barrel shifter has 3*32 bits. The sum is the read pointer of barrel shifter, i.e. the start address of input window. Figure 6-93 is the block diagram.

- Read pointer of barrel shifter: Sum (0x114 BSSR<5:0>); range [0, 63]
- Input window (0x0F0 BIW(#60) <31:0>)

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

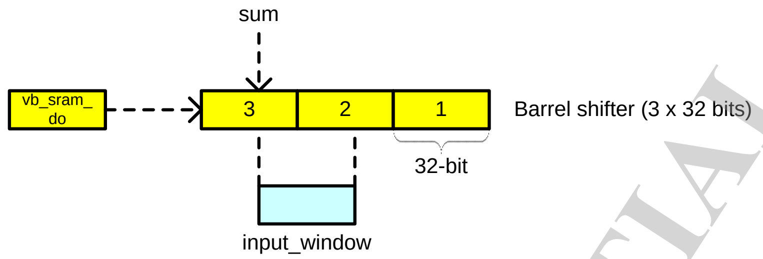

Figure 6-93. Block diagram of barrel shifter and input window

VDEC also provides checksum register for debugging. By checking the values of these registers with simulation result, you can confirm whether the above process is correct. The location of checksum registers are listed in Table 6-31.

Table 6-31. Checksum register

Spec	Base	Reg offset
BITS_DMA		
MPEG-2	**VLD**	**69 (0x114) bit [5:0]**
H.264/MVC	**AVC_VLD**	**33 (0xa4) bit [21:16]**

6.25.3.6 VDEC Output Format

VDEC supports two types of output formats:

- 16*32 Progressive Mode (NV12_BLK)
  - Original block mode (default)
- 16*32 Field Compact Mode (NV12_BLK_FCM)
  - PP, set PP reg 15 bit[28] = 0
  - MC, set MC reg 584 bit[24] = 0

The difference between progressive mode and field compact mode is shown in Figure 6-94. Besides MPEG2, MPEG4 and VP6, it is recommended that the output results are written to DRAM by PP for better efficiency.

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

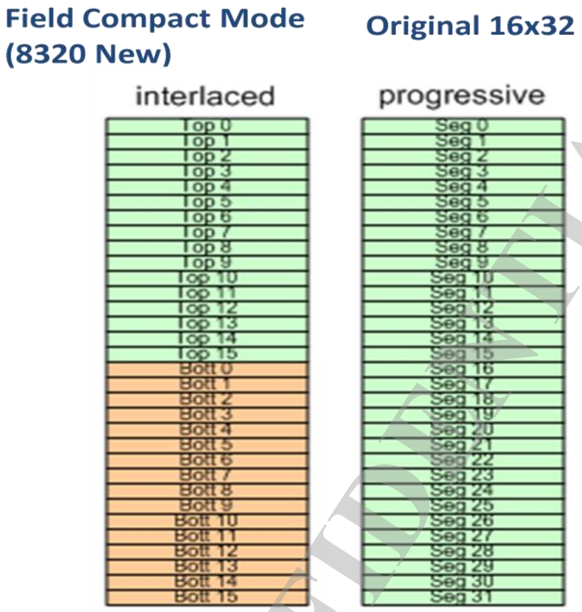

Figure 6-94. Field compact mode and progressive mode

6.25.3.7 VDEC Break Function

This section describes the correct steps for FW to break VDEC before finishing decoding a picture.

1. Set up vdec_break.
   - Set VDEC_MISC reg 64 Bit [0] (vdec_break) = 1'b1
2. Monitor status vdec_break_ok
   - VDEC_MISC reg 65 Bit [0]: vdec_break_ok_0
   - VDEC_MISC reg 65 Bit [4]: vdec_break_ok_1
   - Monitor until both vdec_break_ok _0 = 1 && vdec_break_ok_1= 1
3. Software reset
   - VLD reg 66 Bit [0]: vdec_sw_rst
   - Set vdec_sw_rst = 1 then reset vdec_sw_rst = 0
4. Turn off the clocks.
5. Finish.

6.26 H.264 Video Encoder

6.26.1 Introduction

This design is main stream H.264 video encoder. It is capable of encoding 1080P video at 30 frames per second (FPS) with promising superior video quality. This IP supports various encoding methods that satisfy basic requirements of easy software controllability. Furthermore, with advanced encoding technology, it brings astonishing high quality and low memory bandwidth requirements. It also considers the usage of portable devices and provides several power saving capabilities.

6.26.2 Features

The supported video codec and their capability are listed in the table below.

Table 6-32. Main features

H.264 encoder	Profile	High
	Level	4.1
	Speed	**1080p@30fps**

The video encoder takes DRAM as input, output and working buffer. It reads input frame buffers, executes video encoding and writes encoded bitstream to the output buffer. The driver software maintains all buffers and assigns proper values to the video encoder to allow the hardware to work correctly. Figure 6-95 shows the procedure of the video encoder. YUV420 two plane scan-line (NV12/NV21), YUV420 three plane scan-line (YV12/I420) or MTK block formats are supported.

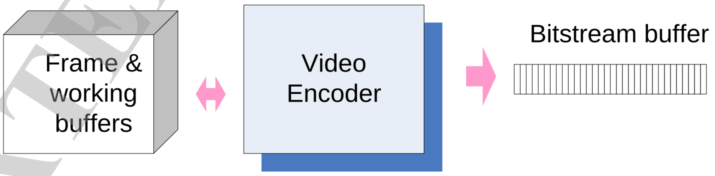

Figure 6-95. Procedure of video encoder

6.26.3 Block Diagram

Figure 6-96 is the brief IP architecture and local on-chip-bus architecture. The interface for controlling it is consisted of ARM APB bus and MediaTek proprietary SMI bus. It reports hardware event through interrupts or software polling. In addition, it adopts several SMI ports and one APB port. The video encoder is configured by software through the APB interface. As the register is configured, the sequencer will send the corresponding control signals to trigger sub-modules. DMA will acquire and store back the image data and bitstream from and to memory according to the configured address. ME will conduct motion estimation to decide motion vector for later encoding. MC will conduct motion compensation to give predicted pixel values. TQ will conduct transform and quantization operation and write reconstructed pixels to DB and quantized transformed coefficient to

EC. DB will conduct de-blocking operation and allow the DMA to store back the processed frame as the next frame's reference frame. EC will conduct entropy encoding, and the coding can be variable length code, context based arithmetic code or context based variable length code. The encoded bitstream will be written to memory by DMA.

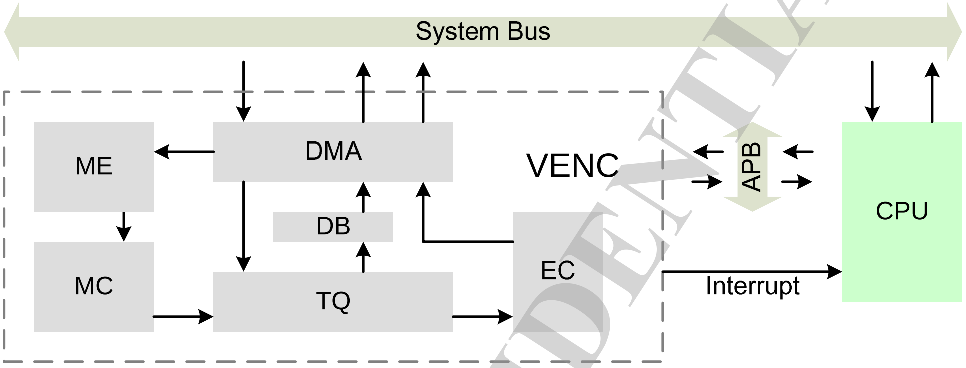

Figure 6-96. Block diagram of video encoder

6.27 MFG

6.27.1 Introduction

MFG contains Mali-T720 MP2 GPU and clock/reset control logic. The Mali-T720 series of GPUs process extremely complicated graphics and perform general processing tasks assigned by the main application processor. This diagram shows the main components and interface of MFG.

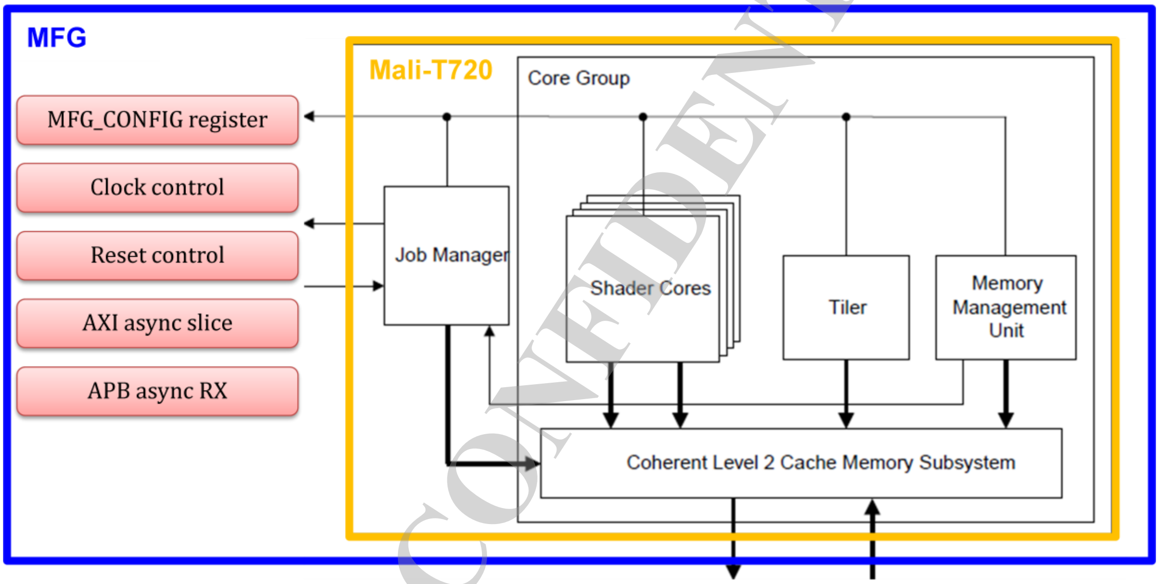

Figure 6-97. Block diagram and interface of MFG

6.27.2 Features

The Mali-T720 MP2 GPU includes the following features:

- A rich API feature set with high-performance support for both shader-based and fixed-function graphics APIs. These API graphics industry standards are:
  - *OpenGL ES 1.1 Specification* at *Khronos*
  - *OpenGL ES 2.0 Specification* at *Khronos*
  - *OpenGL ES 3.0 Specification* at *Khronos*
  - *OpenCL 1.0 Specification* at *Khronos*
  - *OpenCL 1.1 Specification* at *Khronos*
  - *OpenCL 1.2 Specification* at *Khronos*
  - *DirectX 9 Specification*
- Anti-aliasing capabilities
- An effective core for *General Purpose computing on GPU* (GPGPU) applications
- Image quality using double-precision FP64, and anti-aliasing
- Bus protocol
  - 128-bit AXI bus with up to 32 outstanding
  - 32-bit APB bus

6.28 Multimedia Memory Management Unit (M4U)

6.28.1 Introduction

In the smart phone system, the multimedia (MM) engine usually requires a certain amount of contiguous memory region. In order to avoid memory fragmentation, the Operating System (OS) needs to perform memory copy to align the requested ranges with one another. However, excessive memory copy may greatly degrade the system performance. For some performance-critical engines, a common method to guarantee sufficient memory available for them is to statically reserve the physical memory. This solution is straightforward but expensive since a large amount memory is reserved for a certain engine without sharing with others.

The Multimedia Memory Management Unit (M4U), which is also referred to as the IOMMU, is therefore designed to solve the fragmentation problem by paging the memory space and to reduce the cost of static memory reservation. Each page has an identical size of 4KB and can inherently be self-aligned without needing any memory copies. This means the system performance will be enhanced a lot due to exempting memory copies. With the unit of 4KB, the chance of occurring internal fragmentation is acceptable in our system and moreover the virtual memory efficiency is much better than that of using a larger unit of page size, e.g. 1MB. Therefore, with a smaller unit of page size, there will be ample page numbers available in the system. The engines will have even more chances to obtain the pages from the OS.

The major function of the M4U is to translate a virtual address into a physical one by performing page table look-up. As a result, the memory space of the MM engines is virtualized and contiguously seen by the MM engines. Along with the page table managed by the OS, there is no longer need to statically reserve any physical memory for the MM engines on system-up. The physical memory can be allocated dynamically in the unit of 4KB by the OS. From the system cost of view, the physical memory size is greatly reduced.

Since all the MM engines can use the M4U to perform address translation, M4U plays a critical role in MM performance, especially for hard real-time MM engines. The translation look-aside buffer (TLB), a major component in the M4U, caches the page numbers to accelerate the translation process. Besides, M4U performs auto-prefetching function to further lower the impact of page table walk caused by cache compulsory misses as well. In addition, a non-blocking TLB interface is designed to support miss-under-miss capability to achieve high performance translation.

6.28.2 Features

- One-level address translation with 4KB page size
- Two-level TLB structure (main TLB and prefetch TLB):
  - Level 1 is used to cache the most recently used pages.
  - Level 2 performs table walk when TLB miss and auto-prefetching when TLB hit
  - Entry number: 48
- Entry lock in the main TLB for critical pages
- Supports TLB range invalidation and full range invalidation to free TLB entries

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL

- Supports range sequential single-entry and multi-entry mode to minimize the entry usage
  - 16 sequential ranges available
- Supports range wrap mode in prefetch TLB for better address prediction
  - 4 wrap ranges available
- Each master port can be programmed to use M4U or not.
- Supports TrustZone security
- Supports high-performance bus prioritization for transactions with different priority levels

Descriptor format				
31:12	11:4	3	2	1:0
Page number	Reserved	Non-secure	Sharable	Access type

Figure 6-98. Descriptor attributes

In Figure 6-98, bit[3]:NS is used to differentiate secure and non-secure memory region for TrustZone security support. bit[2]:sharable is used to indicate if the coherence access with the CPU caches is required or not. bit[1:0]:should be 2'b10 for a valid 4KB page.

6.28.3 Block Diagram

In the system architecture, M4U is placed between the Smart Multimedia Interface (SMI) and the External Memory Interface (EMI) (see Figure 6-99). In Figure 6-99, M4U is shared by all MM engines and performs virtual to physical address translation for MM engines.

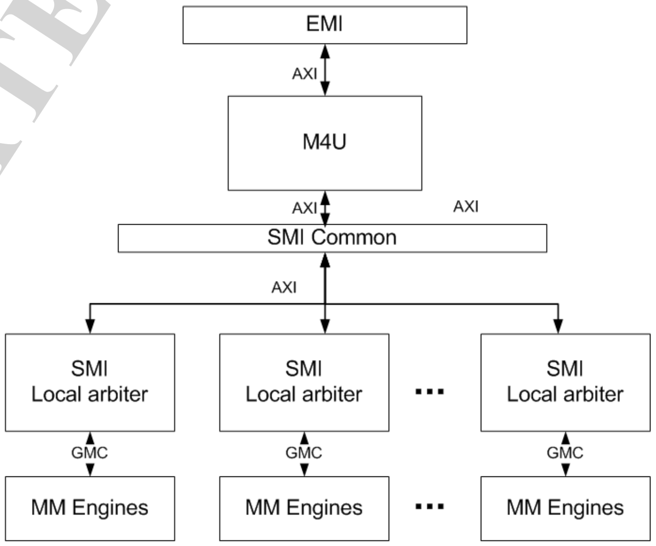

Figure 6-99. MM bus architecture

When a virtual address comes from the master port, M4U will perform page table look-up to translate the virtual address into a physical one. main_tlb and pre_fetch_tlb in (see Figure 6-100) are two levels of caches for the page table. They are used to accelerate the translation process. If a page number is a miss in tlbs, prefetch_tlb will perform "table walk" to obtain the page number in the DRAM. prefetch_tlb contains auto-prefetching logic as well to increase the cache hit-rate. The non-blocking TLB interface is designed to support miss-under-miss capability to achieve high performance translation.

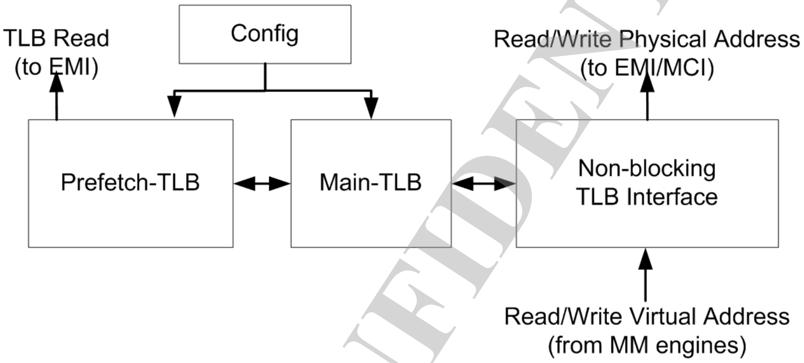

Figure 6-100. Block diagram of M4U

In Figure 6-100, M4U has a non-blocking interface to support miss-under-miss behavior and TLBs to cache the recently used pages.

6.28.4 Register Definition

Address	Name	Width	Register function
10205000	MMU_PT_BASE_ADDR	32	**MMU page rable base address** MMU page table base address in DRAM
10205004	MMU_PT_BASE_ADDR_SEC	32	**Secure MMU page table base address** MMU page table base address in DRAM
10205220	MMU_INT_CONTROL	32	**MMU interrupt control** Controls MMU interrupts.
10205224	MMU_FAULT_ST	32	**MMU interrupt status** Shows the status of the interrupts.
102055C0	MMU_INVALIDATE	32	**MMU invalidation enable** Triggers range or whole TLB invalidation.
102055C4	MMU_INVLD_START_A	32	**MMU range invalidation start address** Start address of range invalidation
102055C8	MMU_INVLD_END_A	32	**MMU range invalidation end address** End address of range invalidation
102055CC	MMU_INVALIDATE_SEC	32	**Secure MMU invalidation enable** Triggers range or full TLB invalidation.
102055D0	MMU_INVLD_START_A_SEC	32	**Secure MMU range invalidation start address** Start address of range invalidation

6.28.5 Programming Guide

1. Enable M4U for the corresponding ports (refer to the SMI_LARB/SMI_COMMON functional spec).
2. Request for a page table from the OS for the working address space.
3. Confirm the memory access behavior of each master.
4. Program the registers based on the master's memory-access behavior, e.g. set up the range sequential single-entry for the scan-line based masters then the range sequential multiple-entry and wrap mode for the rotators.
5. Set the pre-fetch distance to either "forward" or "backward" direction for the ports (default: forward 1).
6. Set up the page table base address.
7. Launch the engines.

Reset	0	0	0	0	0	0	0	0				0	0	0	0	0

Bit(s)	Mnemonic	Name	Description
31:24	**BGR_RSV**	BGR_RSV	**RG_BGR_RSV[7:1]: Reserved register** RG_BGR_RSV[0]: Enable VBGR output to PAD_TESTIIN 0: Disable 1: Enable
23:16	**BGR_TCTRL**	BGR_TCTRL	**BGR_TCTRL[1:0]: BGR Replica VBE TSensor chopping control** 00: Unchop, PH = 0 01: Unchop, PH = 1 10: Chop 11: Disable The current for VBE TSensor is also as the reference of calibrating VBE TSensor for 00/01/10 mode. By setting RG_BGR_CTRL[3]=1 and RG_BGR_TCTRL[1:0]=11,the current source of calibrating VBE can be applied externally (drawn from PD_TESTIIN). BGR_TCTRL[3:2]: PAD_TSOUT output selection 00: Disable TSOUT 01: IPTAT_OUT (for VBE calibration) 10: VBE_MCU 11: VBE_ABB RG_BGR_TCTRL[7:4]: IPTAT VBE TSensor current selection 0000: 100000000 for 1I calibrating VBE 0001: 010000000 for 1I calibrating VBE 0010: 001000000 for 1I calibrating VBE 0011: 000100000 for 1I calibrating VBE 0100: 000010000 for 1I calibrating VBE 0101: 000001000 for 1I calibrating VBE 0110: 000000100 for 1I calibrating VBE 0111: 000000010 for 1I calibrating VBE 1000: 000000001 for 1I calibrating VBE 1001: 111000000 for 3I calibrating VBE 1010: 000111000 for 3I calibrating VBE 1011: 000000111 for 3I calibrating VBE 1100: 111111111 for 9I calibrating VBE
15:12	**BGR_CTRL**	BGR_CTRL	**RG_BGR_CTRL[2:0]: BGR resistor selection for denomerator** RG_BGR_CTRL[3]: Enable test current input 0: Disable test current 1: Enable test current. In this mode, PAD_TESTIIN is used for
